Not necessarily so. You will probably need to try a few combinations, but
I personally would start with jumpers on pins 6 and 11, and a LED
connected across pins 12.

But before doing that, I would type the part number into Google's search
string window, and look at the manufacturer's data sheet. It will probably
tell you which way the LED goes, and other things.

Jim

3337. About Cubase Audio "Offline"

Newsgroup: comp.sys.atari.st
Date: 2004-05-21 16:35:55 UTC
From: DOCs <"docs ifrance.com">
Message-ID: <40ae2f01$0$19643$626a14ce@news.free.fr>
Source record: 18636

Hi,

I used to trust in "Sample Rate Converter" function in Cubase Audio Falcon 2.06.

If I convert a 48 Khz sample to 44,1 Khz sample, I have no problem !

BUT if I take a 44,1 Khz sample and I convert it to 48 Khz, it appears a little cracking sound !

Does anyone have heard this problem on its sounds ?

Thanks

> in the other room I can check) and there isnt much around, consumer PSU
> wise, that would fry that. I do hope no-one was stupid enough to directly
> connect it to the mains...

Well... On the STacy it says 18v, but reading about the supply which
shipped it was supposedly 16.5v. More crucial from the stories I hear
is there being enough current. Sounds like 3 Amps would be perfect,
but that's too close to the 3A tolerances of the voltage regulators.
If I can get the STacy running I'll probably get a 500 MB SCSI laptop
drive from the broken PowerBook at may parent's house- should reduce
the load by a bit.

> Could be that the shifter is dead. Does the stacey do anything else, like if
> you put a disk with something on it in the auto folder, can you hear it
> booting from the floppy?

Some things do appear to work, which tells me it was likely not
connected to mains power. The LCD goes on, the LEDs indicate activity.
The drives start fine, and it does sound like it is trying to boot.
This is why I entertain some hope of being able to repair.
can check for video output.

> Dont touch the inverter, you probably know anyway but just in case you dont,
> they are high voltage.

I know, thanks for the warning!

> Some boards have TOS in 6 eproms, some in 2. I havent
> opened my Stacey to find out (Its a working machine, I want to keep it that
> way).

This appears to be two EPROMs. You are lucky that your STacy runs
well! There are many broken and dead STacys out there, so I'll be
happy if I can fix this one.

> Hopefully when youve repaired the board traces and replaced the burned out
> components it may work ok. Well you can hope.
> Coda.

The traces are fine! The burns were in an out-of-the-way section.
Those burned components probably don't have much to do with the
(dis)function of the unit, they appear to have been for protection
to/from whatever is supposed to connect to J15. More likely what I
need to do is replace some blown semiconductors. The only tricky thing
is narrowing it down to which ones! I've got to learn how to test the
chips, as I am not going to put any rare custom Atari chips in there
without confidence that they will not fry also.
Metrophage

3339. Atari Diagnostic Cart ROMs

Newsgroup: comp.sys.atari.st
Date: 2004-05-21 17:03:55 UTC
From: Atari Only <atarionly@adelphia.net>
Message-ID: <8sudnRuLZt_mqzPd4p2dnA@adelphia.com>
Source record: 18638

I found out last night that my Diagnostic Cart 3.4 is dead. So this morning I pulled out 3.5 it too is dead. Puller out 3.0 works but is old and doesnt have the same test functions as 3.4 and 3.5. I think I may have killed them last time I used them. I though tmaybe the 3.4 died since the label covering the window was off and the unit has had access to the sun for the past 8 months. But 3.5 is gone to and it was still covered. I tested the roms and on each board 1 ROM is dead.

Does anyone have a file for this so I can burn another eprom fopr either 3.4 or 3.5.

Thanks, Don

You know what? I think the first thing you should do is try plugging a
monitor into the rear socket. Either a colour sc1435/philips 8833 or make a
vga adapter for hi res mono. If it works after that then its the LCD
circuit - probably that shadow chip you mentioned.

Coda.

3341. The game called "Bounce"

Newsgroup: comp.sys.atari.st

Hi folks,

I'm not sure if that's the right place to post that question, so please don't flame :)

Back in 1986, I owned my first Atari 520ST+ with TOS 1.0 . There was this great game called "Bounce". Does anyone remember? Was this game freeware? If so, where can it be found for download? If no, hmm, too bad...

Thanks in advance,

Mark

I completely agree with Pierre!

GFA basic is a fantastic language. On my atari 8bit computer I have
'turbo-basic' written by Frank Ostrowski too. Both (GFA-basic on ST and
turbo-basic on XL/XE computers) are very powerfull languages.

Ofcourse all languages has their own profits and bad things.

On my atari 8bit I prefer to write in assembler. This gives me the fastest
results and the best profit of the 1.79mhz only of this fantastic baby.

Thanks to the higher speed of my ST and falcon I can use GFA basic. It is
the best basic-variant I have ever seen.

So Pierre: forget that Steve Sweet fellow, and keep happy with your atari!

Thanks
Marius

I've never tried that. Did you try optimising the partition where the
new file is, in case it is a fragmentation issue?

I'm afraid there's no function for that in PS.
You'll have to do it by hand. Make each letter as an object of it's own.
Rotate, size, and position each letter, and group them into one object once
you're done.

The only DTP application I know of that does this on Atari is DA's Layout, and
possibly new versions of Calimus (likely via an external module?).

You might find an art package somewhere that can do this as a GEM or Calimus
vector file and import? Arabesque maybe, or possibly even something shareware
or freeware on an ftp site. Not sure, maybe if someone knows they will add to
the thread.

The first time I tried V. 0.961 it did crash on Hades indeed. I changed something in the Newsie's prefs.inf and after that Newsie didn't crash anymore.

Not quite sure (maybe Paul can confirm this as I believe I tolded him how to alter prefs.inf) but I believe one have to change the "experimental" line.

I've this:
experimental = NNNNNNNNNN

For me the best mailer/newsreader is, despite his age, still Okami. Maybe CAT is better but it refuse to run properly on my system so I can't give any comments.

When I need to "design" some WordArt-like objects, I use Kandinsky.

Bye,
/Pascal/

Um, as long as the MINIMUM current rating of your replacement supply is sufficient for your needs there is no UPPER limit (only set by wallet and physical size). The circuit will draw what current it needs and no more, assuming that there are no shorts etc of course :-(

Put things into perspective, though. For a computer company that for
all intents and purposes went out of business more than ten years ago
(at least as far as their computer line is concerned), there certainly
is a lot of progress right now, even if not as much as five years ago.
At this point, *any* progress is great progress, in my book.

> The CT60 and SuperVidel are Falcon only, when will Falcon users ever realise
> that the Atari platform is not equal to the Falcon?

Well, the Falcon *is* the most recent computer Atari made, and is much
better designed for upgrading than, say, the ST. The TT has some good
upgrade capabilities, too. So what if much of the new hardware coming
out is for the Falcon? Couldn't you say the same thing if the opposite
was true? If much of the hardware was being designed only for the TT,
you could say, "When will TT users ever realise..." and make the same
argument. For that matter, what would an 8-bit user say?
Unfortunately, you *can't* create one piece of upgrade hardware that
supports *all* Atari machines. Since the Falcon has the PDS slot, a
DSP, and supports relatively more "modern" interfaces, such as IDE,
SCSI, and fully PC-compatible 1.44Mb floppies, it's a good machine to
upgrade. This is of course compared to the ST. The TT has some, but
not all of these features, as well as a few tricks of its own. But in
my opinion, feature-for-feature, the Falcon is better equipt to be the
focus of hardware upgrades.

> As for the Eiffel and EtherNEC these are new, but it's not like we didn't have

> years now, and network card solutions have always been around as long as I can
> remember. In the TT I have a 11 years old Riebl card, in the clone a modern
> ethernet card....

Yes, that is a great set of networking hardware. However, they *are*
11 years old, as you say. Doesn't it make sense to keep bringing out
new versions of the same kind of hardware, as I'm sure many of these

older cards are getting closer and closer to retirement. Once these cards break down, there has to be something to replace them with, right? So coming up with new solutions for old ideas is still progress, in that respect, wouldn't you say?

> >You can read DVD-ROMs with Anodyne's ExtenDOS,

> Hm, sure...
> But this is a bit like the chicken and egg dilemma, in order to read them I
> must be able to burn them first...

I often exchange file data with people who have other kinds of machines (usually PC). Right now, the big thing is to use CD-R's, since they are pretty inexpensive, floppies are getting harder and harder to find, and you can't hold extremely large files (i.e. large digital pictures) on floppies. Eventually, I imagine the same might happen with DVD-ROM's. I'd much prefer to be able to read the disks people give me, even if I can't write them myself, than to not be able to do anything with them at all.

> >Papyrus X! was even released for our small platform,
>
> Sure, and ain't it just great? the speed at which this monster processes words
> and documents is overwhelming.

Not to get into yet another argument over Papyrus vs. Tempus vs. whatever, but of the word processors I've used, I still prefer Papyrus over anything else (including Tempus), even if it is somewhat speed challenged. And I personally never have to work with files so large that it's a problem, so there really isn't any speed difference that I can see, with what I use it for. Also, *to me*, Tempus' user interface is ugly and awkward. Too much is being presented to the user all at once, in a difficult to look at format (for example, I don't use Superscript, Subscript, Light, etc. as much as the basic Bold, Italic, and Underlined, so I don't really need to have all those extra buttons mixed in, in a confusing and very difficult-to-read black and grey mess of crudely-drawn, small, cramped buttons. Fewer, larger buttons, in color, are much clearer and easier to quickly find, and make more sense visually. Papyrus is the only one I see that has that, as well as MS Word compatibility, and other "modern" features. But, in all fairness, I'm a very visually-oriented, aesthetics-minded person. So it works better for me, while others aren't and would rather use Tempus. That's fine.

> >everyone has noticed ACE Tracker etc. etc.
>
> You mean musical minded Falcon users?

Well, weren't musicians a big focus of these machines anyway? Why else would every 16 and 32 bit Atari come with MIDI as standard? They don't exactly make the fastest and best networking ports. And isn't most software designed for specific audiences? I don't use Spreadsheet

software, vector drawing software, or C compilers much, if at all. That doesn't mean I shouldn't be excited and grateful that we have them available for our machines. And there's ST and TT software that doesn't run well, or at all, on my Falcon, but I'm glad it's there for others to use on their machines, and concider all of it progress, if it meets a need.

Like I said... *any* progress on this platform (whether it applies to your exact machine and needs) is good progress, as far as I'm concerned.

Source record: 18557

Is this a symptom of a bad power supply on the current end?

Screen doesn't work when 5v and 12v sides of the power supply are set properly. If I disconnect all the drives, lower the 12v side as low as it will go and crank the 5v side slowly to about 7v, the screen starts working.

I don't do that but for a moment, and not again as I don't want to fry some chips. I just wonder if that is a current issue and what part of the PS might cause it.

The main brick power supply works fine with with my good STacy, so if the problem is power supply related at all, it is the internal one.

Thanks,
Brian.

Mark, this is the place to post :)
I'm not sure about your game.

If you're accessing the newsgroups from a windows PC I suggest you install steem
and browse the links in its info menu. It has tons of ST specific game sites,
often with disk images where you can actually grab the games. I say install and
see, because there's just so many links it would take me an hour to pull the
urls and post them here.

steem can be found at:
http://steem.atari.st

That web site might even provide alot of those links without installing STeem.
Have a looksee.

I'd forgotten all about this problem, and I believe that John Rojewski posted details of how to fix it not long after the release of 0.961. I think the "experimental" line in the prefs file was to be for future use, but the release came with an empty line. The addition of NNNNNNNNNN is all that is required to solve that problem.

I hope Charles will soon be able to tell us that his problem has been solved.

3370. Notator - MIDI Overflow

Newsgroup: comp.sys.atari.st
Date: 2004-05-23 11:41:40 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <fd0sc.31501$l%4.14820@bignews4.bellsouth.net>
Source record: 18564

I've an old Mega ST4 here.
It has TOS 2.06 (Wiztronics TOS board) and Xtra RAM 8 installed.
Hard Drive via Link 97 and HDDriver8.

Without the Xtra-RAM enabled.
Blitter off.
No auto-folder apps.
No desk top accessaries.

Any version of Notator I run here and I get midi overflow and garbled MIDI
output.
Even if no instrument is connected at all and I play a sequence.

This also happens over Unitor2.

Also happens if I switch back to Rainbow TOS and pull out the Xtra-RAM board.

It had worked just fine before....with same hardware config. A new delima.
It also seems to work fine with other sequencers...CuBase2, CuBase Audio Falcon,
Master Tracks Pro, KCS, MIDI Spy, etc...

Any ideas? Do I have a bad hardware timer or something? If so, what next?

Thanks,
Brian

3371. Help ! Problem with a 260 ST !!!

Newsgroup: comp.sys.atari.st
Date: 2004-05-23 14:04:02 UTC
From: Michel Jubault <michel.jubault@free.fr>
Message-ID: <40b0af50$0$7711$636a15ce@news.free.fr>

Hi all !!!

I explain you the problem: Wanting to start again my 260 ST, I had the unpleasant one surprised to have a screen with multicoloured vertical lines then a whole of multicoloured points!

With each time I starts again it I have same Pb exactly! I dismounted the monster : a rapid overflight shows me that a condenser isn't well at one end the face is completely black with a hole! (470 mF, 16v)

I put links to you towards the photographs of what I have (it is easier to have an idea)!
Two screens:
http://lacantina.dyndns.org/sasfepu/images/260st/260st_ecran1.jpg
http://lacantina.dyndns.org/sasfepu/images/260st/260st_ecran2.jpg

The condenser :
http://lacantina.dyndns.org/sasfepu/images/260st/260st_in.jpg

It would be great someone could say to me if it is repairable or if it definitively died!!!!!!!!!!

Thanks in advance !!!

Michel

If the ST hasn't been used for a while, you might want to remove and
reinstall the socketed chips before you do any more repairs. The symptoms
you describe might indicate some bad connections to the shifter or
GLUE-chip.

Might be - but it might also be some kind of rubber seal with a hole for the overpressure vent, so it may be perfectly well.

Check the power supply if you really have 5V - best with an oscilloscope.

And the MMU chip too.

But before reinstalling the chip you have to move a bit all the pins (to external of the chip) to get a better contact againt the pins of the sockets.
And use a special electronic contacts liquid...
I did that so many times to repair ST in the old time...

hi!
Yes but DiVX it's movies too:)

Yes , but DVD use udf files so:)
So maybe it possible to read "direct cd" make with
other applications!
The "soft direct cd" use cdr or cdrw just like hard Disk!

For reading this kind of cd it still exist utility
for simple cdrom &dvd reader only!
It still exist for win and for linux too!

I ask the question because i haven't your driver :"gold"
to do the test:)
But it is maybe a good opportunity to share between
different and &or several computers:)

Bye

Hi !

I've checked the power supply with a digital voltmeter (I've no
oscilloscope) and I've 5 v (5 to 5.2 v) !

Thanks for your help !!

have you checked the voltage accross that capacitor ? normally you get
vertical black and white bars if you loose a address or data line somewhere,
colours indicate a something more problematic such as loss of power to the
ram section. Normally the power goes via a small inductor, it could be
dry...

It is, but the TT's VGA output is compressed horizontally. Not all VGA
monitors can be adjusted to get the proper aspect ratio.

Most Electrolytic capacitors (condensers) have one metal (negative) end which is part of the can and a black plactic (positive) end cap that is held in place due to the the top end of the can being folded over it. Ususally when a capacitor like this blows the end cap blows off and a cotton wool type substance is ejected usually accompanied by some silver foil.
Unfortunately I am unable to view the image of it at this time but it does not sound like this has happened, however they can become short circuit as well which could cause problems. The way to check this is to remove one end of the capacitor from the circuit and measure its resistance, if it is not short circuit the reading will increase (if you have your meter probes connected the right way round) and should decrease when you reverse the probe connections.

I'm not expert but it sounds like it could be a problem with the video shifter, make sure it is in its socket correctly and check any electrolytic capacitors that my be close to it.

General Note:
The electrolite in electrolytic capacitors will dry out resulting in the capacitors going short circuit if the equipment is not used for a long time. If you have equipment that has not been used for a long time (5 years +) the best thing to do is to connect it via a variac set to provide 50V AC output and leave it on for a day so that the electrolytics get trickle charged which can reform the electrolite as opposed to turning them at full load.
I appreciate that not everyone has this facility therefore you should disconnect the output from the main power supply (which has the most

susseptable capacitors) from the circuit board and leave it on for a day. I recommend keeping an eye on it in case something start to burn so you could do just an hour or two over several days.

Then you probably (though not sure) have no power supply problem - most
likely is bad contacts at any of the socketed chips. Try cleaning the J pins
on the square PLCC chips with a glass-fiber eraser (used for retouching
"indian ink" technical drawings)

Hi!

I have not much experience with the technical part of atari ST machines. But I hav lots of experience with the repair and maintenance of atari 8bit computers. It looks like your atari does not reach the OS. The colour bars are the first thing the atari shows in les then a second before the screen turns white and then a disk-boot and desktop comes up.

In your case the white screen does not come ... so there must be a halt somewhere. I think it is the OS_ROM (does an atari 260 st have OS in rom btw.?) or in other case I think it is a fault in your ram-section.

By the way the capacitor in the corner is a piece that takes care of in-disturbance, so I guess even if it is defect, the problem is not what you have now..

I finally got a tower case for my Falcon. It's 22" high. I'll take an ATX psu from a dead pc that I have.....along with the hdd, cdrom,memory, etc. :)

Now all I need is:

To find all the various port extenders....I don't even know what to look for.

A CT60.....don't know where to get one.

And, perhaps, a MegaST/STE keyboard. Would that be worth the cost or would just simply be better to use a pc keyboard? I like the look of the Atari keyboard, but how would I adapt it to the Falcon?

Hopefully I'll be able to get few solutions from all you Atarians out there!! :)

Thanks in advance....

Hi!

Good news:)

Rodolphe don't reply to me for instance!
Maybe no news it's good news:)

For keyboard, piano midi is the best;-)

On falcon, you can use mega st or TT keyboard:)
It is only a phone adaptator, that's all!

If you prefer, new pc keyboard and wheel mouse:
"eiffel card ps/2 is the best choice with CT60:)

Is it worth risking an eye or a fire for something that costs pennies to
replace??.

I think you can find most of the connectors at most electronics stores
(i.e. places that sell circuit components, maybe even Radio Shack,
although I might go with a place that's a little more serious and
carries a bigger stock). Just look for male and female connectors that
match the ports you want extensions for. Then you need the cabling to
go in between. Once you have the two, it's just a matter of soldering
the cables onto the connectors, testing them for a good solder with a
continuity tester (also available at the same place you get the
connectors and cables), and plugging them into the Falcon and
connecting them to the back of the case.

> A CT60.....don't know where to get one.

You might want to just go to the source - Rodolphe. He still has some.

> And, perhaps, a MegaST/STE keyboard. Would that be worth the cost or would
> just simply be better to use a pc keyboard? I like the look of the Atari
> keyboard, but how would I adapt it to the Falcon?

It depends on what's important to you. If you don't mind the extra
cost, and like the original Atari design, it's not a difficult project
to connect it, and the MegaSTe/TT version is an excellent keyboard. I
have a MegaSTe keyboard connected to my Falcon, using a connector
pulled out of a C-Lab Falcon case. Looking at it, it's basically just
a phone jack (also available at any electronics store) with wiring
going straight from the 4 lines in the jack to the keyboard connectors
on the motherboard.

If you are more concerned about cost, the PC keyboard/mouse with
Eiffel would probably be the least expensive.

I personally like the Atari MegaSTe keyboard, because it has the
correct keys that Atari's need (like the Undo key, for example)
without having to re-label a PC-keyboard, or just having to remember
what key has been remapped to Undo, for example. I also think that the
MegaSTe keyboard is the best feeling keyboard Atari ever made, and
even prefer it to my iMac's USB Pro keyboard.

I've never heard of any such add on. It didn't come with the version
of PageStream that I have (2.2SE), and I've never seen it in any FTP
archives. Could you send me this info, too, or better yet - post it?
Thanks!

I have a 520 STFM upgraded to 1 meg on ebay. Only 10 hrs left check it out:

Currently $10.51

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=8106854827&sspagename=STRK%3AMESE%3AIT&rd=1

Thanks, Don

> > To find all the various port extenders....I don't even know what to look for.

Personally, I'd leave the Falcon in it's bottom half of the case and mount that to the chassis as close to the rear of the case as possible. Cut or punch holes the sizees you need to get at these ports.

That just leaves the joystick, cartridge, and midi ports to go.

For the midi ports. The easiest thing to do is just get a pair of male to female extension cables and let them pigtail out of the case through a card slot or a hole that you drill. If you wish to get fancy you could buy mounting type connectors and attach them to your case somewhere.

The jaguar-pad connectors. Do you use these? Again, I would simply hook up the jog-pads, running their cords out through a convienient location in the chassis and be done with it. Just leave the pads connected.

The cartridge port....
Depends on how you use this. If you only have one dongle/device, just plug it in, and forget about it.

Wiztronics can sell you a cartright extender. This is simply a ribbon cable with the connectors you need on each end.

If you only have two dongles/devices, and there is room for it inside the case, you could get a cartmaster light from wiztronics, plug it all in, and forget about it. 4 dongles, you might still be able to find a full version cartmaster from System Solutions in the UK.

You might also find a position to mount the falcon where all you need to get at the cartridge port is to cut a slot in the case.

The keyboard....
Hooking a mega type keyboard isn't hard. Just wire in the proper female jack. Wiztronics likely still carries a product called Mega Keys...wich is a kit and instructions to do just this.

Dekka is another option. Again, Wiztronics can likely sell you one of these. It allows you to plug in a PC keyboard. Do check with them for types of keyboards supported first! It's a pretty old product and I'm not sure if it's ps/2 or something older. I'm sure you can still find one that's compatable...ju st make sure you know so you don't get the wrong thing.

Another keyboard solution...
With some creativity you can make a housing for your current Falcon keyboard. Use a light sheet-metal, a lucite material (like modern kitchen cutting boards are made from), mold your own bondo-like material, or even wood. Use screws as

spacers to get your keyboard at the right angle to your liking. You could cut the top of the Falcon's case and use that for the top overlay....or fashion your own top ;)

Make appropriate holes for the joystick ports, and finally connect cableing and connector types of your choice (as long as there are enough leads).

> > A CT60.....don't know where to get one.

Go to the source. You'll get better service that way if something goes wrong.

> > And, perhaps, a MegaST/STE keyboard. Would that be worth the cost or would
> > just simply be better to use a pc keyboard? I like the look of the Atari
> > keyboard, but how would I adapt it to the Falcon?

The Mega ST and STe are very fine keyboards. They'll last decades the way they are built (with a good cleaning every 10 years or so). They are also quite expensive unless you happen across one in someone's junk sale. To me, it would be worth it to go this route. Depends on your budget really. If you're in a money crunch...just build the wiring you need and remount the keyboard in your present Falcon case ;)

Keep your eye on www.myatari.net for an online how to for the Falc & CT60,
including mounting the falc in the tower, custom cables, Keyboard fitting,
ancillary power supply.

From: Jim DeClercq <jimd@panix2.panix.com>
Message-ID: <c8vg4vmfd1@reader2.panix.com>
Source record: 18450

B&C lists Stacy schematics for 50 USD

If that thing were my problem, and turning up the voltage helps, I would get a can of Circuit Cool, or some other evaporative cooler, and start squirting it on parts in some regular sequence.

The failure mode of a transistor junction is increased leakage due to impurity migration, and increasing the voltage does make up for increased leakage.

So you cool an IC, and if it needs replacing, it will leak less, and work better. Other parts will work less well cold. So if Stacy performance changes when one of its parts is chilled, that part needs to be replaced.

7 volts is a safe value for a 5 volt part. That is in parts books. Some point higher than that is unsafe. 9 volts will cause reversible lockup on 5 volt digital parts, usually, so you will not do any damage with 7 volts.

Jim

Brian Roland <BJRoland@bellsouth.net> writes:

: Is this a symptom of a bad power supply on the current end?

: Screen doesn't work when 5v and 12v sides of the power supply are set properly. : If I disconnect all the drives, lower the 12v side as low as it will go and : crank the 5v side slowly to about 7v, the screen starts working.

: I don't do that but for a moment, and not again as I don't want to fry some : chips. I just wonder if that is a current issue and what part of the PS might : cause it.

: The main brick power supply works fine with with my good STacy, so if the : problem is power supply related at all, it is the internal one.

: Thanks,
: Brian.

From: Pierre TONTHAT <ptonthat@NO.club-internet.fr.SPAM>
Message-ID: <c91il1$th1$1@news-reader1.wanadoo.fr>
Source record: 18456

Bonjour :)

Alert for those who use the Troll (usenet client):

-> DO NOT SAVE the current post (message window, button "~", item "save").

I forgot to close the file after writing it. So if you write/delete on it
with another program, while Troll is still in memory, there will be some
nasty bugs, maybe crash.

Apologizes for the inconvenience

Rajah Lone
http://rajah.atari.org

PS: I'm working on the Troll upgrade (sending posts). The internal editor is
done (though no copy/paste yet), you can also call an external editor. The
beta3 release will come in 2 or 3 weeks.

> assuming that there are no shorts etc of course :-(

This would appear to be the case, but is not always so. So far as semiconductors go, voltage regulator ICs are further from "ideal" than are most. The reason why all regulator chips require several volts of headroom is that they are grossly inefficient, often dissapating 10-30% of their current as heat- hence the heatsink fins on most such ICs. You'd think that drawing "extra" current which isn't used would be like pushing a rope...

Voltage regulators are made with several ranges of current tolerance, most common up to: 100mA, 0.5A,1A, 3A. If the current coming out of a transformer (internal, brick, wallwart, etc) exceeds these amounts, the heat will cause the regulator to malfunction- often causing it to pop or burn. Then then large current of now unregulated current can also cause bypass diodes to leak (even as much as 100%), so the excessive current can appear at data, adress, signal, voltage, and ground pins.

My crash-course in this phenomenon occured about five years ago, when I lost the 200mA wallwart to my TR-707 drum machine. How much current was "too much"? The back of the 707 did not mention a maximum... I was itching to make some music, and the only transformer I could find of the proper voltage and connector was a 12v supply for an old Hayes moden- at FIVE AMPS. I assumed that the 707 would only draw as much current as it actually needed. Within seconds, the display had blanked out and I could smell something burning in the case of my 707!. Opening it, and doing a little research- the 78M05 regulator could accept a >maximum< 500mA input. I had provided ten times that amount. Replacing the regulator ic was easy, but the memory of my 707 was fried, it forgot every pattern when powered off. A year later I replaced every single diode on the board and it resumed its normal function.

Some appliances and most computers can deal with excess current because the features to do so are built-in. Switching supplies which can detect load, fuses, etc. For instance- the STacy might have had a fuse in the brick, but there certainly isn't one on the board! As a result, a person could try to put any electrical supply through the circuitry, possibly with detrimental results.
Be careful!

Exactly what I was thinking! I need to wait a little while so I can
organize my next purchases of electronic components, so I can work
these DIN plugs in with the other items. I have no Atari monitors and
I won't buy any unless I find in-person as the shipping would be
costly. So... I packed my disassembled STacy for temporary storage,
hopefully just a couple of weeks.

RAW - "Another World" engine written using SDL library. Should work on anything a bit faster then Falcon 030 (it flies on CT60
If you want to play under GEM, set enviromental variable

SDL_VIDEODRIVER=gem

You also need an original PC version of the game (called "Out Of This World")

To download see: http://atari.gabo.pl/html/ports.html

Most non CMOS logic devices would go into meltdown at 5.6 volts, making your information potentially dangerous.

I never received email from you after 6th April !

Did you use the correct email address ???
I changed !

I sent you email for that.

Let be clear about my delay to answer...
I answer around 1 to 5 days max.
After this delay you have to consider that there is technical (or human)
problem !

Regards

First, that data came from an actual Motorola parts book, covering TTL parts, which Atari used. It also comes from experience as a test engineer and as a design/release engineer.

CMOS is a construction technique, and does not imply a voltage range.

There are at least IC families for 24 volts nominal, 12 volts nominal, 5 volts nominal, and 3.5 volts nominal, and of course test limits for one family are dangerous to other families. And, there is RTL, to which something else is dangerous, and DTL, which is killed by the same thing RTL is killed by.

What, pray tell, is meltdown? First there is lockup, and later the smoke comes out, but what is meltdown?

Anyway, if 7 volts was dangerous to the circuitry in a STacy, the little thing would never work again, which is contrary to observed fact.

Jim

One advanatage of Atari Computers is that I don't have to be so bloody careful with virus....

ie in last 24 hours I have received over 11000 w/32-sober-G infected spoofed emails... bloody annoying

and what is even more annoying is that the poor sod who is sending them has a broadband connection and doesn't know he's or she is infected... I know they have a broadband or always on connection because of the spread of sending against the ammount sent.

Thats what comes of having a free to use email address.. something for scanners to pick up...

But if you have PC's or Macs you do regulary update your virus checking don't you folks..??

By the way dopn't forget JagFest'UK http://www.uk.jagfest.org.uk/

and I will see some of you in France this weekend...enjoy the holiday guys and gals....

Hi.

Can anyone tell me were I can buy some kind of graphics accel. for
Falcon? I'd like to have (as a minimum) 800x600 resolution (or better
1024x768) with 256 colors... and reasonable refresh rate.
Which one is the best - any quick comparison (including where to buy
and approx. price...)???

Thanks,
Adam

800x600 with 256c if possible on plain stock Falcon - try Videlity, Videl Inside, Blowup or any other program like this.

...but those viruses usually fake the sender's email address. I have
received some emails stating that I have send virus infected emails to
people I don't even know. Strange, because I'm working with a Mac and
I surely can't send out Windows viruses ;)

Greetings,
Matthias

I received an email from Rodolphe today, he registered me for a CT60!!!!!

Now I just have to figure out how to pay him...the simplest way I can find,
from the ways he told me.

Then I just have to patiently wait....and while I am waiting, I'll begin work
on re-casinf my Falcon!!!

Thanks,

Sam F.

hi!

It's just fine :)
Rodolphe, you are the best:)
Another future enjoy guy in the world:)

The CT60 is really plug and play:)

Just take a little time to read all the docs:)

The 3 parts on rodolphe web site!
And the great job from didier mequignon
st guide format:)

It still exist new software too!

Prog for test the rapidity!
Soft for manage sleep atx power!
And i find yesterday
new package name utility for ct60!
I have no time to test that today!

bye,
jpierre

Ok. Discovered you needed the DOS version. That in place and tweaking
the settings
on my setup, I get to the Code Wheel / Code Entry screen, but then nothing
effects the program.
I can click anywhere in the window and hit any key that I want and it just
sits there.
All other functions are working fine, I can iconify the window and move it
etc, just can't determine
how to enter the code to move on into the game.

> I'm trying to whitelist you, check your mailbox.
>
Still nothing and my attempts to mail you again, failed with the spam
report.
I tried with a different account a few days ago, but I have not received
anything
back from that mail.

Hello All!!

New CT60 owner(almost, just got registered today!!!) here!!!!! :) :) :)

Question 1: Are .img format pics the only format we can set as a background?

Question 2: How can we set a pic as a background and size it so the entire
image fills the desktop (screen)?

Question 3: If img is the only format we can use, then what is used to convert
other formats to img?

Thanks to all for all your forth coming help!!!!!!!!!

> Question 1: Are .img format pics the only format we can set as a background?

This would depend on the desktop you use. If under plain GEM, then you'll need some sort of desk-top image utility.

I don't know right off the top of my head what desktops support which image formats. Check your docs and see.

> Question 2: How can we set a pic as a background and size it so the entire
> image fills the desktop (screen)?

Again, this depends on your desktop.
Also depends on the resolution you're in.

Some desktops, like Magix and NeoDesk have a slew of options for desktop images, such as tile, center, fit-screen, etc...

It's quite common to use a small 'pattern' graphic and tile it so it fills the screen. If you're low on memory this is the wise thing to do (or use no desk-top image at all and stick with the regular GEM patterns).

If you are wanting a full screen image, it is likely best to build something with that in mind, that is exactly your screen size. You might even put graphical place-holders and whatnot where your icons, notes, and what-not will go.

Perhaps the most important thing to consider when choosing a desktop image is the pallet of colors it will use. 2, 4, 16, and 256 color modes work with 'fixed pallets'. This is why you'll sometimes notice your desktop change to strange color schemes when launching a new program, then change again with a different program, and go back to normal when you switch to the desktop or close out the other apps.

True Color is the easiest mode to do a desk-top image for. Pick what you want, and start using it. There's something like 16million colors avilable, and they aren't 'palleted' per-se.

256 Color mode is the next easiest to work with. In general, you'll want to run a conversion on your image that locks the first 16 colors at the default system colors, and can use the rest of the pallet as it likes in combination with dithering techniques.

For booting in 16color resolution and less, you'll want to make sure your desk-top image uses a pallet of only a few colors, preferably the default, or some subset of ANSI colors, stored in sensable places of the system pallet.

As a general rule of thumb, for monochrome and 4 color resolution, you'll want to stick with dithered black and white images (or whatever 2 colors you choose).

For 16color mode, 2 to 4 colors should be okay...more if you're really careful about the pallet used.

Check docs and experiment is my best advice.

> Question 3: If img is the only format we can use, then what is used to convert
> other formats to img?

When working with desktop images...the number of colors, and the pallet order is very important. You'll want to do more than simply 'convert' some nice picture into a PI1, PI2, or PI3 file. If it's really colorful photo-type image, you'll have to dither it down to fewer colors. Then you might want to reserve the lower 16 colors or so for common system uses. Really, it takes a little practice to see how the desktop behaves and swaps pallets between applications etc...

I personally use Image Copy 4 CD for most conversions. It's a commercial product. I'm not sure where you can find it these days. It is a VERY GOOD image viewing and conversion package! It supports pretty much every bitmap format out there, and offers several dithering types when converting to lesser colors. Image Copy can optionally use the Falcon's DSP to open compressed formats. Image Copy does have some degree of choices for choosing and locking in pallets for viewing or converting an image; however, it might not be enough should you intend to really do top notch desk top images that make sense and maximize your avilable pallet.

Hi Soft's True Image/True Paint package, also commercial, has quite a bundle of image importing and exporting modules as well. It also has a variety of dithering and pallet types to choose from. A cool thing about this package is that it uses the DSP to open compressed formats. Tools like these will allow you to tweak and set your pallet up to something senseable for a desk-top image.

If you're really serious about working with bitmap images...particularly with scans and photo quality stuff...Photoline is the way to go. This is one of the few, if not the only, GEM packages that can scan directly into the program using the right scanner drivers. It supports the more popular bit image formats, and has perhaps the best editing features avilable for image 'processing' for the Atari/GEM platform.

PixArt is a drawing tool that supports scanner drivers. It imports and exports most of the popular bitmap formats.

Apex Media is supposedly really good. Particularly if you are into animation. I've never seen it in action myself. Maybe there is a Demo out there somewhere you can try.

Beyond this, scour the FTP sites.......
Off and on over the years there have been offerings in the free and share-ware libraries for image conversion and manipulation.

If you've EasyMint installed....there is undoubtedly a plethora of unix tools out there for image conversion as well.

Hope this is helpful,
Brian

Well... you're right. I can get 800x600. But what about hardware acceleration (1024x768 or similar)?
The CT60 project... As far as I understand this is designed to work with (and only with) CT60 card which isn't cheap and I guess I won't have that...
So still asking - any hardrware graphics acceleration that I could buy for reasonable price (less than CT60's 300 Euros)?

Thanks,
Adam

IIRC there are ready-to-use-free 68000 cores for FPGA's, but:

1) They are not that fast as someoune would like them to be
2) They do not emulate whole instruction set

Code Entry Screen works somehow sluggish and sloowish (don't know why). Try cursor keys (keep them pressed for a while) and Return (also keep it pressed) and it should work. Or get a version without code entry screen (North American version called 'Out of This World' does not have it).

You might find a used CT2B that someone is removing to make room for a new
CT060?

>be like pushing a rope...

Um - no. A regulator dissipates power, not current. The idle current of normal regulators is in the dingle-digit mA range - definitely not enough to cause much heat.

Linear regulators require some minimal *voltage* drop between input and output - how much depends on type. Now if you want to reduce 12V to 5V, giving a 7V drop across the regulator, the dissipated power depends only on the voltage drop and the current which the attached circuit draws, so using a low-drop regulator will not reduce power dissipation in any way.

>Voltage regulators are made with several ranges of current tolerance,
>most common up to: 100mA, 0.5A,1A, 3A. If the current coming out of a

This is nonsense. Look at the datasheet - voltage regulators are spec'd for (minimum) dropout voltage, maximum input voltage, and *maximum* output current. Some regulators require some minimum output current to stay in regulation, but if this is the case, then it is also clearly stated in the datasheet. There is no spec for a "current tolerance".

>transformer (internal, brick, wallwart, etc) exceeds these amounts,
>the heat will cause the regulator to malfunction- often causing it to
>pop or burn. Then then large current of now unregulated current can

Current does not simply "come out" of a transformer - it flows through the regulator *and* the load. Usually, the load requires some specified *voltage* (that's why you are using a *voltage* regulator, right?). The load then consumes as much current as needed for operation. As long as the supply is capable to supply that current, everything is OK.

A supply that is *capable* of delivering more current is no problem - it will not do so, since the load does not draw more current. Provided, of course, that you supply the load with the rated voltage, and not with a higher voltage or reversed polarity.

>Opening it, and doing a little research- the 78M05 regulator could
>accept a >maximum< 500mA input. I had provided ten times that amount.

No. The 78M05 is spec'd for 500mA *output* current, and since the load is fixed (the machine), you can not exceed that by using a power supply of higher current rating. However, by connecting a supply with a to high (or in some cases too low) voltage, or wrong polarity, or AC instead of DC, you can easily fry something.

cu

Yes I know. I just exploited a bug (or feature according to Micro$oft).

It's maybe a (so called) standard but that doesn't mean it's a good
program. Thanks to careless OE users I get daily lots of virusses.

Also OE really can't quote. It's sometimes very difficult to read a
thread.

There are lots of good Windows newsreader available. To name a few:
Agent, Xnews (I use this on Windows), Pan (Windows/Linux. I use it on my
Linuxbox), Thunderbird, etc ...

ps. You can patch OE so it will quote properly. I believe I told this
to our friend Sweety quite some time ago but ... he doesn't give a damn.

See <URL:http://home.in.tum.de/~jain/software/oe-quotefix/>

Take care,
Martin

There are two ways to do that. Get either Ghostscript or Porthos.
Ghostscript can be downloaded from the Internet. Porthos you have
to pay for (about $40). I have both, but Porthos is far the better
way, but you must have a multi-tasking evironment.

3484. Vortex HDPlus 60 and Atari ST + Monitor problems

Newsgroup: comp.sys.atari.st
Date: 2004-05-29 14:25:01 UTC
From: Eduard Werner <edi.werner@gmx.de>
Message-ID: <40b8ace4$0$13300$9b4e6d93@newsread2.arcor-online.net>
Source record: 18529

Hello,

just pulled out that ole Atari ST (1040 STFM, 3MB RAM) and found the
following problems:

- With the HD connected, it won't boot (no matter whether the HD is switched
on or off but the boot sequence used to be 1) turn on HD, 2) turn on
Atari). W.o. HD, it's working. How can I track down what's wrong?

- The picture on the monitor (SM 124) slowly pulls more and more to the left
until it's unusable (after about 30 secs). Switching the monitor off
helps, so I guess it's sth warming up as shouldn't.

Cheers

Edi

>Ghostscript can be downloaded from the Internet. Porthos you have
>to pay for (about $40). I have both, but Porthos is far the better
>way, but you must have a multi-tasking evironment.

At least the demo version of Porthos runs under single TOS. But, you will need NVDI (V.5 ?) and probably WDIALOG.

On the other hand GEMGS (Ghostscript for TOS) can be used and seem to be usable on 4 MB RAM. Just tested it on a MSTe and it could render at least the two simple pdf's I tried. It's very slow but does not need any NVDI or m-task.

The whole package takes 5.5 MB on the harddisk with the app itself at 1.5 MB. I had it convert the pdf to IMG files and it worked but the result ended up in the \TMP directory with wrong file extender.

On a 16 MHz 68000 it's painfully slow... 2 minutes from launch until the "GS>" prompt appear. Another 3 minutes to get the IMG file at 100 dpi. At 180 dpi I got errors due to lack of memory?

On the TT with lots of RAM it performed better...

Can be found at:

http://www.felschonline.de/c_atari_en.html

You will need at least:

http://www.tu-harburg.de/~alumnifc/download/atari/gemgs/gemgs13-bin.lzh
http://www.tu-harburg.de/~alumnifc/download/atari/gemgs/gemgs13-en.lzh
http://www.tu-harburg.de/~alumnifc/download/atari/gemgs/gemgs13-fnt1.lzh
http://www.tu-harburg.de/~alumnifc/download/atari/gemgs/gemgs13-fnt2.lzh
http://www.tu-harburg.de/~alumnifc/download/atari/gemgs/gemgs13-lib.lzh

A total of almost 4 MB to download.

I'd probably recommend that you use a PC keyboard and mouse and one of the adaptors (Eiffel, QWERTY...) to connect them to your recased Falcon. That gets you over the problem of recasing the keyboard and also gives you the right connectors at both ends.

IMHO GEMGS isn't the easiest program to set up or use, so if money and OS are no object I'd definitely recommend Porthos.

Anyway, don't forget to thank DDP Translations for the English versions of both these apps :-)

I had the same problem with a Nemesis accelerator and NVDI - the answer is to use either a printer spooler or that special printer tracking thingy - there was an Auto folder and an SLB version?

EW>switched on or off
we'll need more information please. Which brand of HD? How many ACSI
devices? Termination? Which CSI-ACSI adapter? ...

EW>but the boot sequence used to be 1) turn on HD, 2) turn on Atari).
Right!

I guess something with DMA is wrong. The floppy and ACSi buses do
interfere. One of them bad may influence the other.

EW>How can I track down what's wrong?
I'd try to hook the HD to any other ST/TT and look what happens.

3491. Atari 520ST and Amiga 500 For Sale

Newsgroup: comp.sys.atari.st
Date: 2004-05-30 20:11:15 UTC
From: o_morris100@hotmail.com
Message-ID: <351b8aec.0405301211.2f0b29ce@posting.google.com>
Source record: 18534

Hello,

I hope you don't mind me posting this here, but I have a lrage amount of Amiga and Atari stuff I would like to sell. I may split the lot if enough interest.

The full list is:

Unboxed for the Amiga are mostly copied games, however still work as they should:

street fighter 2
gauntlet 2
the winning team disks with manual
black crypt
james pond
CIV
Dune 2 with copied manual
deluxe paint
populous 2
eye of the beholder 2
operation thunderbolt
flashback
pinball fantasies
pang
addams family
frontier elite 2
shoot em ups volume 1 - 10 games
missile command
pom pom gunner
punisher
elite
gun boat
20 blank disks for saving etc

Lotus 3 is unboxed but it has a manual.

Boxed for the Amiga is

covert action
utopia
powermonger
f-19 stealth fighter
MiG-29
Syndicate
Hero quest with copied data disk

Advanced destroyer simulator
Carrier command no manual
Nightbreed

Atari:

Unboxed games are:

Lemmings
UK language disk
Atari games disk 1 ï¿½ Space harrier and Bomb Jack
Atari games disk 2 ï¿½ Outrun and carrier command
Atari STOS Program Disk
Atari Language Disk

Boxed games are:

Skystrike Plus ï¿½ No manual
Populous
Space Gun

There is 1 mouse for each console and 1 mouse which has a switch to switch between the consoles.

There is 1 joystick for the Amiga which I have tested.

There are 3 joystick for the Atari which I haven't tested, and 1 funny little joypad called ï¿½the Bug' for the Atari, which again is untested.

There is also a spare floppy disk drive for the Amiga which is untested; and doesn't seem to be of a lot of use except for maybe copying floppys.

All the necessary cables, power cables and - for the Amiga - the power supply are present. There are also some games which I tested but appeared to ï¿½Play Up' when tested, which you can have for free if you so wish.

Open to sensible offers. If you live locally, dorset, you may collect or ï¿½15ish to post it.

Regards, Owen.

3498. [UTD] June Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2004-05-31 08:17:07 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <c9epgi$6lc$2@news-reader2.wanadoo.fr>
Source record: 18542

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka406.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

The handling of OpenGL extension has been modified,
rendering modes were added, the RAM usage is better
handled. The program's resources have been optimized
for a similar interface's look. Shortly, we do a better
job without having to cope with a "fat program". That's
what I like !...

I wish you big fun with all this new STuff !

Best regards,

-- Franï¿½ois LE COAT
Author of Eureka 2.12
http://eureka.atari.org

That's excellent news Charles - congratulations ! Now life can get back to normal for you. To think, only a few years ago none of us had e-mail. However did we manage !

If you get time, it might well be worth trying again to set Popwatch up. Even if you don't connect it to a mail reader, like Okami, you can still use it to look at your mail box, and delete offending mails. I know you can do this in Newsie, but I think on this occasion you might have been able to delete the sticking mail with Popwatch where Newsie was unable to do it.

All the best

Paul

3505. some questions about 520st

Date: 2004-06-01 03:34:34 UTC
From: "|<evin" <nospam@nospam.com>
Message-ID: <cvtnb0pa6meotg7dcn71bqr4qahrvcntdf@4ax.com>
Source record: 18400

Okay I have an ST, but it is the original 520 with an external floppy and only 512k ram. The power connector (to the wall) on the power supply is missing (apparently it was nibbled off by a dog and lost) is there another compatible atari connector that will work? (like a 1050 or 800xl powersupply?) if not I could just wire another plug right?

Most games require 1meg? Is there some easy way for me to upgrade this model? Are there any recommendations for games that will run with 512k?

My biggest question: is there something like the SIO-to pc cable for the ST?

thanks in advance!
kvn

3506. Re: Desktop Backgrounds(aka wallpaper)

> New CT60 owner(almost, just got registered today!!!) here!!!!! :) :) :)
>
> Question 1: Are .img format pics the only format we can set as a background?

No, but it depends which desktop you use...standard TOS you will need a
program like deskpic. It can use GIF, IMG, and also has its own internal
format (GFB, not sure how that works). MagicDesk has its own inbuilt
background picture thing, Jinnee does, Thing I'm sure does...others may
do...

> Question 2: How can we set a pic as a background and size it so the entire
> image fills the desktop (screen)?

Cant remember if any of the desktop background programs can resize
pictures...deskpic certainly could not. It would be very slow on a
standard Atari to resize, but maybe tolerable on the CT60...

> Question 3: If img is the only format we can use, then what is used to convert
> other formats to img?

GEM-View 3 is what I used...

You might be stuck on this. Almost every solution I've seen requires a
Mega ST or better, Mega STe and above.

The ST (F,FM) and STe systems have no provision for graphic upgrades,
and case space is very tight, so as far as I know no upgrades for the machines
exist. (Actually I lie, ST class machines can be updated to STE spec by
piggy backing two chips)
The MEGA, TT and Mega STE all have provision for a graphics card. There
are quit a few options for these machines. I don't know what provision
the Falcon has, but there are certainly upgrade options.

Yes buy a 1Meg ST or STE from Ebay. Or even a 512k STE and a couple of
1meg simms.
>Are there any recommendations for games that will run with 512k?

There are lots of games that will run in 512K. Depends on what you like.
My personal fav is Buggy Boy which I think will run in 512k.

>My biggest question: is there something like the SIO-to pc cable for the ST?

Not that I know of. You can us PARCP http://joy.sophics.cz/parcp/

3513. Re: Graphic system upgrade for STe

Newsgroup: comp.sys.atari.st
Date: 2004-06-01 20:43:38 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <vR5vc.368$F2.153@bignews6.bellsouth.net>
Source record: 18408

For speeding up the STe...
There have been a few upclocking kits for the CPU over the years that can be bodged into an STe. Check the remaining Atari vendors, as they might have something in the back room that will fit.

There are also kits for speeding up the serial port (the stock STe does 19200 tops). I say 'kit', because some were sold with the parts and instructions boxed and labled. This is likely something you could find a DIY on the net and order your own parts for if you really wanted.

The STe holds 4meg of SIMM memory. If you haven't already topped that out, it's an easy upgrade. Almost any 1meg, 30pin, 70ns or faster sticks will do the trick.

Getting more than 4meg of memory into an STe is quite a challenge. Marpet made some boards that one 'might' be able to hack into an STe. Even so, it would require TOS 2.06 or MagiC to take advantage of it.

For enhanced graphics...Alla VGA...
I'm thinking there was something called "The Panther" that gives the STe one ISA slot. For this slot, there were some NVDI drivers for at least one graphics card, tho' I do not recall which card (for some reason I'm thinking ET4000).

My memory is foggy, but I do believe the Panther was designed with the 1040/520 STe machines in mind. One solution was to recase the motherboard and mount the card inside. Another was to run a ribbon cable outside the factory case, where your graphic card would live in a no frills project box.

If he's still lurking around the Atari buissness, I would suggest asking Nima (Homa Systems) about anything graphics related for the Atari. It's my understanding that he has been quite instrumental in developing alot of things on the software end for Graphics cards. He also sold and supported (possibly a developer as well?) the excellent Nova cards, adaptors, and drivers.

Again, my memory is quite foggy....
Try a web search for "Panther Graphics Atari" etc...
Even if you can't find the ready built hardware kits for sale anywhere...it should be something you might could build yourself provided you can find the software bits somewhere.

Another thing to consider...
You might find a Falcon or TT, or even build a fast linux box for ARAYM for what it cost to buy or build a graphics card that may or may not work very well in the end.

One of the advantages to having enhanced graphics is the ability to see/process large-colorful images. An STe tops out at 4meg of RAM (unless you're very

resourceful and creative). Keep that in mind! To get much accomplished you'd likely need some sort of virtual memory to hard drive tool (outside?), or expensive software that can manipulate images from disk, which would slow things down considerably. Alas, another reason it might be wise to get a different machine than to try to slap a card on an STe. True, the graphics card will have memory built in and allow large fancy desktops, but that doesn't stop the STe from gobbling up more memory to drive the card when it comes to jpegs and such as that.

The STe is perhaps the best machine Atari ever built for running STOCK apps. MIDI, GAMES, etc, that don't call for lots of memory and screen real-estate. Wish I had one around for that purpose ;) When it comes to power user set-ups, such as MiNT, or hot graphics workstations, you might be better off just getting a new machine with lots of RAM and the graphics capabilities you desire built in. Falcon, TT, Hades, Milian, PPC, or Intel.

Brian

3514. MPTi english resources

If the HD doesnï¿½t spin up after being unused for a long time,most likely the heads are glued to the platter surface(which is coated with some fluid).You can try whacking it to spin up,or even open it to free the heads,backup the data and toss it.Modern HDs have a specially treated landing zone or lift the heads off the platter,so this is no more a problem.

3518. Two Weeks Till JagFest UK 12/13 June

Newsgroup: comp.sys.atari.st
Date: 2004-06-02 05:15:39 UTC
From: nick@1632systems.co.uk

Well first of all thanks to Pocket, Arethius, Scat and other who made the Jaguar Connexxion in France a real nice place to be. Plenty of games, plenty of collectibles, plenty to see and do...

But now come the Brits with JagFest'04, June 12/13... are you planning to come and see whats happening in the UK Atari World? We still have some more work to do but the event is shaping up nicely with the following attractions.....

Licensed Bar -- A little liquid refreshment to help the RAFFLE go down

Jaguar
Battlesphere Tourney run by Gaztee plus all the latest and Greatest Releases inc Songbird and B&C - see and buy the games and protos you only thought you would hear about.

Lynx, a selection of the ebst games and prototypes around

Atari ST-STE-TT-Falcon
Full Papyrus X demos, and sales.
NEXUS Gaming Competition (TBA)
Maggie DIsk Magazine
Who will have a similar programme to last year (ST and Falcon), but with new demo's since last year of course Chris's Falcon is now F060! Also there will be the miracle of selected hits of Atari 8-bit on CT60, through the miracle of emulation.

Atari 8 Bit
The Devastator II, a fully functional MAME controller for your PC.

Magazines
Premier On-line Atari magazine MyAtari, and Retro-Mart plus a suprise??

Tournaments
Asteroids 7800 run by James Perrow
Tournies organised by Steve Moss, more details on web pages

Side Show
Commodore Scene will be in attendance with a C= side show .
They will be bringing the '4 player Commodore stand' and a bunch of 4 player games for people to play on. Also, they will probably be bringing our portable SX64's (x3) along with some software to show off and some of the new hardware too.

Emulators
Gamebase ST

Rob Perry - Will be showing the progress he and Paul Thompson has made on their GamebaseST project . Find out how easy they have made it to run ST games under emulation, all wrapped up in a mame32 type frontend.

Atari Portfolio
Portfolio Club (U.K).
Europes premier Portfolio supporters, the Portfolio Club will be along to show off all things to do with the Atari handeheld. Find out more Portfolio stuff at www.portfolioclub.cwc.net

More Infomation can be found at http://www.uk.jagfest.org.uk/

All Weekend Pass Holders will recieve 2 free gifts for supporting JagFest UK..... a JagFest Keyring (gasp!!) and a Free full copy including Hint Book of Oxyd for Atari ST, STE, TT, Falcon, PC or MAC (even bigger gasp!!). In fact JagFest are feeling so generous we will give the Basic Oxyd pack to the first 50 who come to JagFest on Saturday or Sunday.

If you want to come along for the day, it's only £5 and you are sure of a good time, with friends new and old.. just contact me at nick@1632systems.co.uk

Hope to see you soon.

Nick Harlow

It's a Vortex HDPlus 60, as I said. It comes in a case, connects with a special cable and has the CSI-ACSI adapter inside. It's the only device connected to the bus.

Cheers

Edi

That's exactly what I want to do. It does spin up though, so that's not a problem (yet), as it's the Atari which does not come up with the HD connected.

Cheers

Edi

Message-ID: <168c84f1.0406021335.4711f6f0@posting.google.com>
Source record: 18421

Yes, the memory I've already upgraded to the max 4mb, though I'm not goign to be doing any superdemanding so I'm not woo worried about that. I'm loathed to put my STe aside for a TT, Falcon or Hades as for one thing the budget is minimal, and I've already put quite a lot of effort if not money into the STe which I'm loathed to give up on.

I did a lil digging on the Panther card, it did indeed exist and it was the Tseng ET4000 chip that does the tricks. So, with that in mind, I can only give it a try, not goign to give up that easy...

Re: Recasing. As it is, my system is in it's orginal casing. I'm not sure how easy it is to get hte Desktopper these days, but am serious considering moving it into an ATX housing, prefably, but not neccessarily desktop, and using a PC keyboard and mouse. I know the key'b and mouse is both possible and easy enough to do, BUT just how risky is it restting the motherboard as I forsee almost certain drilling great big holes in the motherboard to mount it... just how risky is it? Ive only ever seen it done once and that was with (you guessed it) a Falcon. Also, will any ATX case do, or is there any one that is paticularly good for the job?

Yes, I'll do that. Meanwhile I've discovered another hitch. Some of the
URLs I need to post to have 1 or 2 letters longer than NEWsie can contain.
I get too many rejected because <.com> has been sent as <.co> etc.
Does anyone else have this problem?

I have yet to find a way round this. I wonder if that site that supplies
abbreviated urls can help (I don't know its name)?

Thanks,
Charles.

Maybe Mr GFA can sort that bug out - he's just released a new NEWSie
version.

No you were telling the truth, you CAN'T upgrade an ST to an STE. Do you
mean upgrade the TOS? this will not give you an STE.

> The MEGA, TT and Mega STE all have provision for a graphics card. There
> are quit a few options for these machines. I don't know what provision

Hello.

I need a copy of the manual for the SMP 24 or SMP 2.

Anyone got a spare one or can advise where one may be found?

Barrie.

3533. AtarICQ 0.160 released

Newsgroup: comp.sys.atari.st
Date: 2004-06-03 17:23:31 UTC
From: gokmase@bigfoot.com
Message-ID: <366c6d2a.0406030923.41085452@posting.google.com>
Source record: 18428

At last, there is a new release of AtarICQ available! Since the last version was uploaded, many things have happened that made this one get delayed over and over: I got a CT60, which I needed time to install and setup properly. Furthermore, I shortly after experienced a serious harddisk crash which took quite some time to recover fully from. Anyway, things are slowly getting back to normal again now :)

In AtarICQ 0.160, you should not expect any major changes. Instead, there are some important bugfixes present and even the overlay has been updated again. Here is a brief list of the most important additions and changes:

No hardcoded limit for the number of contacts you can add! The internal
arrays can be adjusted dynamically on the fly now! (Big thanks to Lp for sharing the GFA info!)
Configuration for sound has been bug fixed and should be much better now
The OVL has had another update, so now aICQ can talk to eg. Trillian and GAIM. Furthermore, some problems with receiving ICQ messages of certain lengths (at least that is what seemed to be the problem) has been fixed.
A problem with reading registration data from file has been cured
Fixed a problem where sometimes the wrong window was given "focus"
XBIOS sound should work on Falcons now (Big thanks goes to Deun!)

As usual, you can read more and download the program here:
www.ataricq.org

Regards,

Joakim

Hi everybody.
I use STCad 1.63 but when Nvdi 5.03 is active, I have an error when
STCad starts : access fault : bus error.
When Nvdi is off, it's ok.
Configuration :
Hades 60/magic 6.10/Jinnee/Nvdi 5.03/Stcad 1.63
Any idea ?
Thanks.

Understandable :)
Giving up on the STe was not at all what I had in mind. There's far too many jewels that run best on that machine just like it is. I really meant, 'if you can find a high end machine for less than the ET4000 upgrade would cost, ADD it to the collection.'

> I did a lil digging on the Panther card, it did indeed exist and it
> was the Tseng ET4000 chip that does the tricks. So, with that in mind,

Good luck finding one. Homa (In Canada?) or one of the German shops are most likely to still have some.

> Re: Recasing. As it is, my system is in it's orginal casing. I'm not

> drilling great big holes in the motherboard to mount it... just how
> risky is it? Ive only ever seen it done once and that was with (you
> guessed it) a Falcon. Also, will any ATX case do, or is there any one
> that is paticularly good for the job?

It shouldn't be that difficult or risky.
In my opinion...for a non portable recasing, the bigger the case, the better.

Don't drill any new holes in the STe motherboard itself. Instead, drill the chassis to fit the MB and use nylon or rubber spacers to mount your motherboard. The main thing is to make sure the case is large enough.

I've never done this, but as I think it through here is what "I" would do. I might try it with my Falcon someday ;)

Forget the whole tower case idea....
Go find a nice aluminium flight suit-case with suitable deminsions...popular for cameras for instance. Use either woods, or lucite sheets with proper glue to cut out an instrument panel to your liking (surface area to mount buttons, keyboard, etc). Put a flat panel TFT-VGA screen in the top half of the case,

and mount the STe, powersupply, disk-drives and graphics card in the bottom half. You could do the keyboard part a number of different ways....either using the exiting keyboard solidly mounted in the case, or make it removeable on wire, or totally repalce it with a PC or Mega keyboard of your choice. Some kits exist for using non atari keyboards...the latest I is called Effel I think.

As for specific 'plans' for my 'portable Atari'....I have none to offer...if it were me, I would hunt parts, be creative, and design the case as I go, solving problems one by one.

Reguardless of your choice for a chassis...be it a tower, desk-top, rack, or something portable as I mentioned, these are the basic things to create solutions for.

One of the neatest things of all about the STe, is that it runs very cool. Cooling is not an issue unless you've upclocked it, or put it in a case with several HOT running disk drives or something (not so common with modern drives). In fact, alot of music studios don't get rid of their ST machines for this very reason. It runs great without a fan...NO FAN NOISE...so alot of things in the actual sound room gizmos get run by ST machines to this day ;)

1. Power supply....
If you intend just to use the the existing STe power supply...no problems at all. Just wire in a power switch as you like.

If you get a case with power supply and intend to run the STe from it....
The main thing is having a power supply that does not DEMAND some sort of motherboard control (modern power saver features). Some of the newer power supplies don't have a traditional 'on/off' switch anymore. Be careful of that! Otherwise, it's easy...just match the voltages as needed...pretty standrad stuff here. Ground, +-12v and +-5v. Do pay attention that there IS a difference between + voltages and - voltages.

2. Port access....
One solution is to mount the MB as close to case edges as possible, and simply drill/punch the holes you need. Another is to make pig tails and or harnesses to extend the ports to anywhere you'd like them.

Another option is to just leave a nice big hole somewhere to let all your origional cables run inside the case and plug in where they go. This is fine if you tend to plug everything in and rarely change stuff around.

3. Cartridge/ROM port. If you never use this...just forget about it. If you only have one device, plug it in and forget it. If you use it all the time, with several devices...there's a few options.
a. Mount the MB in a position where you can just punch a hole to access it.
b. Extend the port with a ribbon/card-edge kit, (I.E. CartRight from Wiztronics)
c. Mount a dongle switcher such as Cart Master or Combiner, plug in all your dongles.

4. The last biggie is the keyboard and joystick ports.
a. Remount the origional keyboard in the origonal STe case and use phone

cord to build a cable to the STe MB. Design in connector types and positions to your personal liking.
b. Aquire a mega or mega STe keyboard. Wire in appropriate connectors for the cable.
c. Use a keyboard adaptor for PC type keyboard (Deka, Zkeys, Effel).
d. Be ultra creative and fashion your own new case and cables for the origonal STe keyboard. If you can bodge together a bottom half to cradle the keyboard, you can actually cut just the top part of the case that you need for something that looks factory built. Materials you might try for a bottom tray to match the top are light sheet metals easy for a novice metal worker to fashion, lucite materials, moldable plastics (like car bondo), and of course wood.

Try. It depends very much on the copy protection. In some cases, a certain track is physically damaged and the program wants a read error there before starting up. In these cases, ProCopy won't help you. If the copy protection is merely sth like an additional track, it will work. So you will basically want to try several copy programs and verify your copy.

Cheers

Edi

Hello Tim, have you tried to repair them? If the SF314 P/S is Gray colored
like the SF314, you may be able to turn it Bottoms Up! On the Bottom are 4
screws. If all that is wrong is a Blown Fuse, you can open it and replace
the Fuse. Also, about the 520ST P/S, look on the bottom on the 4 corners,
look for Rubber feet and pull them out. If this is the right 520 type P/S,
you should be able to stick a screw driver in the hole and open the P/S!
If all that is wrong is a blown fuse, try replacing it. Good Luck!

==Thanx==

3548. configure sting for plip

Newsgroup: comp.sys.atari.st
Date: 2004-06-04 16:30:57 UTC
From: Eduard Werner <edi.werner@gmx.de>
Message-ID: <40c0b37f$0$13308$9b4e6d93@newsread2.arcor-online.net>
Source record: 18444

Hi all,

I'm trying to configure my STFM for plip. I've installed sting and the plip-module, everything seems to load ok, the drivers are found by other programs (ping.prg, for example). My only problem is: How do I configure the IP address? On my linux box I'll do sth like

ifconfig plip0 <myaddress> pointopoint <atari-address>

but what's the equivalent on the ST? Furthermore, the sting documentation shows nice control panels, where are they??

Cheers

Edi

Yes the SF314/354 are 3.5" Floppy Drives. My PS has a female connector end,
so it plugs into the drive which has a male port. I also another drive that
has the reverse orientation. What is yours?

Tim

Those missing control panels are .CPX files, which go where xcontrol.prg
can find them.

> And cpx need xacc, cops.....

What are xacc and cops?

> And need a tos 2.06 too!

I have tos 1.4.

I have found xcontrol.acc somewhere and installed it. Now I can set up the
ip address, it gets saved into sting.prt in the root of the drive. I set the
ip address of "Centr. PLIP" to 192.168.1.2 in the cpx module and routed
"Centr. PLIP" to 192.168.1.1 in route.tab (the plip0 of my linux box).
Hmmm. ping doesn't find anything on my atari, neither ping 127.0.0.1, nor
192.168.1.2 (forget about the other box) :-( What am I missing?

Cheers

Edi

well let me tell you what I did this afternoon. I took a PS cable
that plugs into a monitor and cut it in half, plus bared the wires.
Then I sliced the black wire and soldered the other two with the ST PS
and wrapped the whole thing up in electrical tape. Then I checked to
make sure power was getting from the new transplanted plug into the
wire leading to the brick... all was good, until I plugged it into my
sf314 NOTHING! I'm thinking now that whoever owned this PS proably
fried the brick and the PS is useless. Im hoping the sf314 works, I
dont know what to do.... try to buy another ST, try to find another
SF314, try to find a PS for the SF314....

Hi I have a SF314 PS and I think the fuse might be blown in mine. The
problem is it has some strange looking screws on the botton... they
are not phillips, flat, or torx what are they?

thanks

I was able to open my PS, once opened there were two parts (one gold
thing and circuit board thing... I dont see a fuse... what happened?

BTW I opened the it by grinding down a pair of needlenose pliars so
they would fit in the holes and using them to turn the strange screws.

3564. CT2b Freezes, Any ideas?

Newsgroup: comp.sys.atari.st
Date: 2004-06-05 00:39:25 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <nI8wc.2715$Oc4.2398@bignews1.bellsouth.net>
Source record: 18359

I'm having all sorts of fits with my Falcon CT2b lately.
Latest Flash bios I can find (1.39 I belive).
HDDriver 7.93

As clean a setup as possible for booting and testing.

In any extended resolution, using CentScreen or Videlity, under any OS I happen to try (MagiC/Mint/Geneva/TOS), the system will boot and run seemingly fine for 15 minutes or so, then I start getting 68000 exception errors, then either a freeze, bombs, or BUS error message. Eventually, the machine refuses to even boot in extended resolutions as the machine warms up.

My target resolution is 800X608X256 using the 32mhz clock.
Till recently, I'd been runing it like this for a while now with only occasional lock-ups.

I should add that I've experimented with several resolutions, using all three clocks (32mhz, 50mhz, and 25mhz). It would seem that ANY RESOLUTION I try using Centscreen or Videlity to lock in leads to problems.

If I stick to the built in resolutions...not using Centscreen or Videlity, then I get a stable and fast machine that's really hard to crash

Any ideas what might cause this?

Has anyone tried putting a heat-sink on the videl or has that anything at all to do with it?
Would I be wasting time and money to install some kind of fancy cooling system with a CT2b?

I don't recall it ever being this bad. Have checked for the obvious bad connections, opened the case, and have a fan blowing over the entire mb.

Thanks,
Brian

> Hmmm. ping doesn't find anything on my atari, neither ping 127.0.0.1, nor
> 192.168.1.2 (forget about the other box) :-(What am I missing?

Start like this on the atari.

0.0.0.0 0.0.0.0 plip(whatever the driver's name is) 0.0.0.0

Comment out everything else in the route tab. This way we KNOW all tcp/ip data
is going to that plip port.

Provided you have STing running, The Main CPX, the port CPX, and the Protocols
CPX, whatever comes and goes from STing will use that port now.

Unless you intend to use one of the Atari's other ports networked to yet another
machine....just leave that default route in play...it's all you need.

Don't forget to put an 'arp' entry in your linux box.so it doesn't trash strange
packets or just push them out the front door (to the inernet or wherever) over
some other port (such as ethernet). I'm not sure how, but you do have to tell
linux that there will be icp/ip packets coming and going from LPT?.

First try to ping the Atari from linux.

Once you get that working, go to linux and configure the route tab there for
your Atari's IP.
I.E.
192.168.1.2 255.255.255.0 plip0 0.0.0.0

This way linux is now masqurading, and you can ping from Atari, and otherwise
get to the rest of your network/internet using the Atari.

Hope this helps,
Brian

How kind.

The way the system grew in that article was pretty much from the point your standing in now, the machine was basically re-cased first and all the goodies added as they became available. At least now you have a insight into what you're going to need to complete the project.

> data is going to that plip port.

Tried that before. (BTW, plip is the only connection I want to use.)
Tried just again. Same result. (See below.)

> Don't forget to put an 'arp' entry in your linux box.so it doesn't trash
> strange packets or just push them out the front door (to the inernet or
> wherever) over

You don't do that manually. You just issue sth like

ifconfig plip0 <linux-ip> pointopoint <other-ip>

and the necessary routing information gets added automagically on a decently
recent installation (checked that, too, of course). But the linux box is ok,
routing table looks good, and ping, telnet etc. to its own plip address
(192.168.1.1) works.

> First try to ping the Atari from linux.

I'd like the atari to see itself first. But neither ping 127.0.0.1 not ping
192.168.1.2 (the assigned ip address) works so there's definitely sth amiss
on the atari side.

First both machines should be able to see themselves, shouldn't they. Then,
when we know the local setup is working, the connection between them gets
interesting.

Cheers

Id vote for broken fan on 030. I had similar problems because 030
overheated, so machine didnt even boot untill it calmed down...

> Would I be wasting time and money to install some kind of fancy cooling
> system with a CT2b?

Probaly. Try checking the fan first, or ensure that it has sufficient
airflow... Fan may be dead or turn slow... good one need to spin preety
fast...

If ocassional freezes occured in N.AES, try to increase qsbchars buffers
and sstack size.. There are 4 lines in naes.cnf, icrease them by 2.

Agreed...
I jumped into the thread late and thought that much was working.
If STing can't even ping itself something's missing.

Check that all the proper CPX are enabled. Make sure they are 'active' (a
little check box in main STing CPX and Ports CPX). Double check you've the
latest TCP/IP protocols CPX and STX(1.40), and check your settings. If you have
any other ports installed, remove them all but the plip for now (move the stx
driver to a hide folder, or rename driver st?). Make double sure you've not
installed/enabled the masqurade STX, as that remaps the ip scheme quite a bit.

Good luck,
Brian

Ah, that did the trick. I've thrown out masque.stx and now the Atari can ping itself both on 127.0.0.1 and 192.168.1.2. I'll check the rest tomorrow, that is, today after some hours sleep. Thanks for your help. Now I'm only lacking an NFS client for TOS ...

Cheers

I think the question being asked: Is there an SIO2PC-like cable to connect an ST to a PC? Solutions would be ethernet (a few different options) or serial with applicable hardware/software. You can search this group and find a lot of discussion about ST to PC connectivity.

I am using SCSI ethernet with STing (see http://www.anodynesoftware.com/ethernet/main.htm). I'm waiting for ordering info about an EtherNEC card that uses the ST cartridge port (see http//:hardware.atari.org/.

Edward is correct, you can use the SIO2PC cable for ST to 8 bit. He helped me set mine up :-).

Source record: 18384

> I have 1.2. Where do I find I.4? And does it work with TOS 1.4?

Yes. Try here:
http://www.ettnet.se/~dlanor/sting/html/index.htm

I recommend that you study that page well. Various bits of STing get updated from the distribution archive.

Sorry, there are no nfs drivers for straight TOS. Only Mint. Getting it to run on a 4meg or less 68000 machine? Good luck ;)

There are FTP and HTTP servers for STing.
B_NET allows TOS machines to mount networked drives to the desktop. This might be an option if you run an Atari emulator on the linux box.

Using AFTP as a client on the Atari end is the next best thing to nfs. It has a nice drag and drop GEM interface that one can almost treat as a 'disk drive' on the desk top.

Lately I've moved to gaFTP (A TOS/TTP command line based client) and here's why.

For FASTER ftp connections, I recommend using gaFTP on the Atari. For reasons unknown to me, it's 10 times faster transfering files than AFTP. Another neat thing about this program is that you can make little FTP batch files for things you do often and just double click them and vrooom....all done.

An Example:
I have a script that backs up (appends) new/changed files on the entire system into a zip file.
Next it calls gaftp and passes it this script: BACKUP.FTP

```
open mypc
login name
password
lcd "E:\USR\ROOT\BACKUPS"
cd "D:\Atari Tank"
binary
put "Falcon Backup.zip"
bye
```

You can also set up your desktop so that double clicking these scripts launches gaFTP and it does it's thing. Here's an example of one to simply connect to a favorite FTP site, move both local and remote directories to those I'll be using and wait for my manual input.

```
open mypc
login name
password
```

```
cd "C:\My Music"
lcd "D:\USR\BJR\My Music"
binary
```

Hope this helps,
Brian

> NVDI..
>
> Videl don't need a heatsink...

Okay, checked versions and I'm at the latest (from the CT2.ZIP archive on your website).
Checked auto foloder order. I still get a fairly stable Turbo mode if I DO NOT use any extended resolution. Anything outside the normal Falcon video modes and the machine boots, runs a few minutes and either locks solid, or begins spurratic errors (nothing duplicable or the same each session...all different types of errors...most commonly 68000 exception).

For now lets look at a MagiC 6.01 session.
Only criticle auto apps/accs in play.
Launching order as directed.

I've noticed that here lately, even on what seems a stable session, ST-ZIP complains of bad CRC in archives that I know are just fine. Boot in TOS 4 Turbo mode, or with CT2b off, and the archive unpacks just fine.

I still 'suspect' overheating, but not positive. The fan on the CT2b is working, the top is off, and I have other larger fans blowing over the mother board.

I visually checked the connections from the wires...they 'look' fine.
If there is a 'particular' connection I should double check, please let me know.

Any ideas?
Brian

3591. Copy protected disk image project. Seeking beta testers

Newsgroup: comp.sys.atari.st
Date: 2004-06-06 04:57:19 UTC
From: ijor23@yahoo.com
Message-ID: <cd9e9458.0406052057.7d6f5977@posting.google.com>

Seeking beta testers with a Discovery Cartridge made by Happy Computers, and access to a fair amount of original ST copy protected disks.

Project for handling copy protected disk images. Tools for producing images, preservation, writing images back to disk, using the images under emulators.

The package supports different hardware, *including* a plain ST. Different capabilities are available depending on the hardware. But currently I'm seeking *only* testers with a Discovery Cartridge. Contact me if you have one and are interested.

Mine auto folder is like this:

stuff
NVDI
CENTSCREEN
MINT
DSPIRQ

works pretty well, and i found DSPIRQ should be dead last....

> I visually checked the connections from the wires...they 'look' fine.
> If there is a 'particular' connection I should double check, please let me

>
> Any ideas?

One still:

I have problems with CT2s pins for flat cable connector. I have reseat the connector from time to time. It happens that kbd ACIA dont get clock sometimes and system freeze. Mainly that happen after transport etc, but it did in middle ow work as well... Still if u cant boot (black screen?) it can be overheating. When my fan died, it still turned, just not fast enough... try new fan

Is there any particular reason why this upgrade is based, as far as I can
see, on Newsie 0.960 and not the latest 0.961 ? IIRC there were a couple
of minor improvements and bug fixes in 0.961. Is the released source
the one of Newsie 0.960?

Bonjour :)

Reminder : Troll for Atari is a next generation newsreader.
You can now send posts with it.

Download on my homepage or directly on
http://rajah.atari.org/files/ -> trollb3_uk.zip (100 Ko)

New features:
- Bugfixes for:
- lack of file closing (message saving).
- WORK and CACHE folder not found if on the top of the HD partition.
- infinite loop = freeze when a post cannot be downloaded (headline
is listed, but the message has been deleted on the server).
- random crash on headlines downloading (moreover if the newsgroup
subscription is very new). Carefull, problems may remain.
+ Display option: message can be masked if rejected by the filters.
+ New subject or message reply.
+ Awaiting messages (to be sent) management.
+ iso-8859-1 conversion while sending
+ Internal text editor (in the message window)
+ Possibility to call an external text editor
+ Clipboard management for the message window (copy only if newsgroup
reading).

Please report any bug you find, and suggestions ou'd like to have.

Regards

Hi Brian, I did find a bug in Centscreen that caused it to lock up on
boot, if the NVram setting on my CT2 was set to an ST res (ST High), it
locked up every time. I set the NV to 640x480x16 colours and it cured
it. I don't think this is causing you any problems by the sound of it,
but thought you might like to know.

Mark

Yes, the released sources were 0.960 indeed. IIRC you are also corrent
in that 0.961 was a minor bugfix.

I've been overwhelmed by spam emails, I'm getting about 200 emails a day. I've also got little time, but I'm going to get all out standing orders done this week. I've built most of them and will need testing.

Any leftover stock of parts will be sold off in a single sale, thats including EtherNEcs and Eiffels.

I work full time now, and so looking for someone to take over building of the EtherNECs/Eiffels. I can send all the files, and I think if it's possible with atari.org to let someone else maintain the hardware.atari.org website.

Interesting you mention this little bit of TOS 7 boot modes.
More on this in a moment.

I think I got the CT2 stable again.
1. I warmed all the solder connections on the mb to reseat them.
2. Cleaned and reseated the ribbon cable connector.
3. Reflashed the BIOS (just incase some static or something got into Flash ram and set/unset a nibble.
4. Changed fans.

Between these four tackles, I think one, or a combination of them ironed things out. Time will tell for more certian.

Back to the TOS 7 boot options.
I've noticed a cursor bug when booting into my EasyMint setup.
As Mint does its boot up, I see a cursor at some points (it blazes past pretty fast), and by the end of init, the curosr is missing. Giving the \033e code doesn't bring the cursor back either.

BTW, booting in 16mhz or 50mhz TOS 4 mode, and the cursor is there.

The guys on the Mint mailing list say it is a NVDI 5 bug.

Back to TOS 7 mode.

I boot to the mint console without NVDI, and sure enough, the cursor is always there.

Now, here's the interesting part....
Sometimes (but not always), if the CT2b boot colors are changed to 4 color mode, the screen goes black text on white back ground (instead of yellow on blue if cntsrn is disabled) and the cursor usually shows up like it should. This almost always works if the stored setting is 640 X 480 X 2 when the machine is powered on, then change the 2 to 4; however, when 4 color mode is SAVED, I only get the cursor once out of a dozen boots or so.

I also tried the other color settings...same deal as far as the cursor goes...the catch is that some strange pixil stuff happens on bootup.

I very rarely ever see a cursor when booting in 2 color mode. Every now and then it's there on boot...but 99% of the time it's not.

All this makes me wonder about that silly 'nvdi bug', and if some kind of patch can't be written to bring the cursor back %100. What's going on anyway? A console without a cursor is very much a headache. It'd really be nice to be able to use the console for tweaks and changes with vi or pico before going into an AES. Would also like to do more compiling and such straight from the console rather than via TOSWIN.

It would also be interesting to know if there are little apps that can change the cursor type - blink rate, etc...of the NVDI vt52 screen. Given the knowledge of the VDI, such apps should be small, quick, and easy to do. Anyone?

Thanks,
Brian

No sheep here...but I do have a dead upright vacume cleaner I keep forgetting to toss. Maybe I'll mount my Falcon in that so it'll be on wheels. Some bungie cords and I could even strap my midi-board to it handtruck style and have a ready to roll setup!

Personally, i use virtual consoles for that. WAY faster as console and
also accessable when u have AES going. Also usable for long downloads etc,
since u can switch AES resolution or crash AES, exit if etc, and
applications in virtual consoles are not affected.

Unfortunately, no. In the archive which I keep there is only binary
of the program itself. Infobox says it is V0.961, dated July 27th 2000.
I has grown from 216256 bytes of V0.96 to 216802 bytes.

Btw. probably the most useful single quick-fix of Newsie would be the
removal of the bug which produces a number of lost sectors each time when
the program encounters some problem, or exits unnaturally- because of a
very inadequate handling of the log file.

FamilyNet Newsgate

For those that have been trying to reach the Atari Hangout Chatroom at www.jrthompson.org/atari unfortunately the server is down and the webhost is not sure when he will have a server setup in the near future. Will announce when it comes back up.

Let me see if it works.
Strange enough I can't see what I type. Only after I touch the return or backspace key for instance I see the line I typed.

???
I do have have this but at home, nor the MagiC users on the
fr.comp.sys.atari.
Do you have NVDI or other VDI ? what font and height do you use for the text
?

Bye

Pierre

It seems it was a temporaly problem. Right now everything goes well.
For the font handling I'm using NVDI 5.03. The font I use is Monaco
13pt. As OS I'm using freeMiNT 1.15.12/ N_AES 2.0

TTFN,
Martin

Well,

before you get a cooling system try working with the machine with no cover - just motherboard in the open air. I have heatsink and fan on Videl and DSP as well as small selfadhesive heatsinks on SDMA and two additional fans which blow the warm air out of the Falcon's case...

If machine locks without cover on then there is no cooling system which could help, I guess...

hope this helps

Not so.
You're just BLIND to what you percieve as mistakes made by anyone other than
Americans.

I see people from all over the world do the similar, or worse things all over
the newsgroups. With one exception. It's very rare I see any Americans
behaving as rude and small-minded as you.

Furthermore, location is secondary. First, he asked ONE SIMPLE YES OR NO,
impersonal, generally directed QUESTION.

>> anyone making/selling the atari ST type of joysticks, for "Reasonable"
>> prices? looking to play games on my st again, and need a joystick.

The rest may follow. Americans call it DIALOGUE. It's why some 'idiot'
American designed newgroups at some 'idiot training American university' to work
as 'topic threads'.

That leads me to believe he wishes to know if anyone (or any company) still
produces Atari compatable joysticks for a reasonable price.

A typical response from a 'civilized countryman' might be something like:

> Sorry Scott, but to the best of knowledge these type joysticks are no longer
being
> produced. Several places still stock them new, refurbished, or used however.
> Best Electronics (USA): http://www.best-electronics-ca.com

others via
> switch, jumper, or changing a couple of wires inside.

I'll leave the links for other places in the world to someone else (althoe I
know many, and do regular buisness with a few).

Now, why is it that 'Europeans' are so good at ripping the rest of the world apart, but have nothing constructive to offer (or just keep what could be offered in a dark cold closet)? Jealious are ya? Ticked off at American liberties, polotics, comparatively low taxes, economy, entertainment, foriegn policies, etc.....??? Well then...get off your duffs and create something besides stuffy hypocrits for a change!

Brian

Under MagicPC I had to experiment a bit to get it to run.

Important things for me were

8 bit color mode. While it should run elsewhere, basically it wouldn't
run for me without this.

Turn on all the TOS compatibility flags you can. For me this was in MagiCPC
and in NVDI for MagicPC. Maybe not all are necessary, but with a modern
PC the slowdown is not noticeable.

With that combination and the right files, I was able to run the program
without
any major complaints. However when it exits, the system really wants a
reboot.

Dan

Dude,

Go blow it out your ass. Americans are taught improperly from the ground up. We really have to take an outside interest in the rest of the world. It's not thrown at us. For the most part, Americans don't look to the rest of the world because they don't really need to - they have what they want and need in their country already, and it's quite likely that many people who are newcomers here do not realize how international of a medium this is. Other people in other countries surely make the same mistakes too. Usenet was developed in America right?

Your little angst problem likely isn't related to this guy at all. In fact, the Atari using crowd is generally very intelligent and the stupid crap that you see coming from America has nothing to do with them at all.

Frankly I'm fucking tired of everyone in every other country always assuming that all Americans are retarded imbiciles who are the direct causes of all that ails the world. Face it. Everyone is different - America is the melting pot of it all, so everything you hate about America or Americans comes from people who come from yours and every other country.

Besides.. Did you ever stop to think that maybe he didn't mention that he was from America because he wants to consider international sources as well? Only non-americans can rub two brain cells together long enough to think that far right?

Ah, Sorry about this,

I've been very busy preparing to travel and preparing to enter my car in several shows. The Atari generally takes last place throughout the summer months. But I'll see what I can do.

Thanks,
Mark

I agree Simon....
That was my point ;)
Obviously not all Europeans (the minority actually, as with any nation) are rude and small minded, and I certianly would not draw that conclusion based on forgetting something in a thread about joysticks, or for not thinking things through exactly the same way others might.

It was sarcasum.

Lets go back to constructive talk :)

Brian

I don't understand. I thought you had the source?

Fwiw, I grabbed it out of interest. Although I can't compile it take a peek
in mailbox.c, specifically strtoka(). There's a definate null dereference
via parse_mailbox_header().

Sorry Sam, I'm not close enough to help you out in person.
Here's some tips however that should ease some fear.

First, lets make some decisions about the power supply and switches.
Will you be using a new/external PS or the one already on the Falcon?

If you are going to use the origional PS, do you want the switch in the back, or
moved elsewhere in the case?

With the CT060, I would recommend planning on at the least, relocating the power
supply from where it normally sits on the Falcon mb. In fact, I think it might
be a requirement, as the CT060 board may be large enough to extend out to where
the ps was origonally mounted.

If you haven't already removed the bottom half of the shielding, just leave it
in place. It's not necissary to take the mother board out of this at all, as it
should lift right out of the case and will serve as the perfect cradle for
protecting your mb from shorting pins on the bottom, and crackage from moving
the thing around. Taking the mb out of this cradle is a lot of extra work, and
it moves the project from one of almost no risk at all, to one of slight risk.

Get a sheet of stiff paper or thin cardboard.
Gently lay your Falcon on it.
Trace the deminsions and mark all the mounting holes, port locations, and
anything else you plan to make provisions for in the case.

Cut out this 'bottom template' of your Falcon.
Use this template for the rough work thus reducing the chances of damaging the
Falcon. The closer the cardboard you use is to the thikness of the pcb the
better, tho' it doesn't have to be the same. The template will also increase
accuracy in any cuts and drilling of your chasis.

Next, take your template back to the falcon and line it up again. Tape another
strip of cardboard to the back-edge of your 'bottom' template (where the ports
are), line the Falcon up on the template again, and fold this new strip up 90
degrees so you can get marks for all the Falcon ports, buttons, and switches
that you want in the back of the case. There are a number of approaches you can

take to designing this back template. If you don't have fancy tools such as a sheet metal punch....then lets go for the easiest cutting approach, which is one long even open strip all your ports can slip into. If you're leaving the power supply in the origonal position, don't forget a slot for that switch and plug in as well. I recommend drilling a spot for the reset button; as you can always wire in as many additional reset buttons as you like, and put them anywhere in the case/keyboard. Remember, if we leave the Falcon in its lower half of the origonal RF shielding, you've got a nice even metal backplane with all your little female port screws already in place. So a long slot cut in the back of chassis is all you need. You'll fit the Falcon up nice and tight to the back of the case, and can even make it air-tight if you really want/need (for optional vapor cooling....likely unecissary for ct060).

Now, open your target case.
Remove everything in it that gets in the way. Namely the AT/X mounting posts. Some cases have mb mounting posts that can be removed with screws, while others are molded in and will have to be cut or drilled out. Dont' be afraid...it's just a metal plate and will never show again once you put the cover back on so cut and drill all you want, and don't freak if you make a mistake. Use your cardboard template to determine the best position and orientation of the Falcon within. Once you think you have it just as you like, tape down the template, get out your drill and drill out the mounting points.

Hopefully you have or can find spacers or standoffs and screws to mount your Falcon with. Electronics and hardware stores sell them, or you can just improvise your own from platic washers or by stacking nuts on the bolt to the height that you want. If you go with stacked metal bolts, you'll want to top it off with a non conductive washer (rubber/plastic/nylon).

Next use your template, spacers, and screws to loosely mount this fake Falcon in place. This way we can begin to get an idea of how high the mb should be mounted (how many spacers) and what needs to be done to the back of the case.

Experiment to find the best mb height for the ports. I.E. mounting the template higher (more spacers) and lower (less spacers) to line things up best. Some cases have a nice long flat backplane just under the expansion card slots with some of it already punched or cut for prexisting ATX ports like keyboard, mouse, serial, video, etc. If you're lucky, you won't have to do much cutting at all. Once you've got things all lined up....make your marks to the case and go cut it out. Tips...if the back of your case can be unscrewed and taken off, it makes it easier (most can)....so take these extra steps to remove the back of the case. Use your worktable and do your cutting. A good metal jigsaw blade (have some spares in case you break one) and possibly a drill with 3/4" or 1/2" bit should be all you need. Tin nibblers will also do the trick for most case metals.

Now, you're ready to mount the Falcon.
If you've decided to move the power supply....remove it and put it aside.

That's the most difficult part :)

Next focus on the power supply. Did your case have one already? Did you have to remove it to make room for the Falcon?

If you have a bigger powersupply and plan to mount more than one or two low power drives inside the tower, I recommend you use it. Even if you had to remove a big bulky power supply from the case to make room for the Falcon mother board....we can still relocate it and make good use of it! Simply find a good place to mount it out of the way inside the case (lower or upper front, and try not to block off anything you'll want/need such as port or drive spaces. Simply extend the AC plug in to where you'd like it in the case...or, just drill a hole, line it with a rubber gromlet, and run an AC power cord to where it needs to go. I've even seen some people mount a 6 strip power outlet inside the Tower...it can come in handy for quick and easy plugging in of gadgets ;).

Once you've decided where to mount the PS...be it a new larger one, or the origonal Falcon one....have solved the problem of how to plug it into AC, you must exchange/extend the cableing to the Falcon motherboard (unless you've positioned the origonal PS close enough to the mb that the existing wires are long enough....slight chance of that).

Extend your cables, make sure the voltages match up. If it were me, I would study where the wires go into the origonal PS, and lable each wire with tape as marked in the origonal PCB before I did anything else. I.E. Blue 12v, Red 5v, Black Ground, etc. Once I had that done, I would desolder or cut the cables from the PS PCB and then extend the cables as needed, then match them up with the power supply I will be using. The main thing to be careful of here is note there is a difference between + and - voltages. Your new powersupply may have more or less wires than you need, on that mainboard connector that you'll cut off to wire in the Falcon one. At any rate, you'll just need +- 12v, +-5v, and Ground at the most. Any wires left over that you don't need, just tap them off with electrical tape or connector ends and stuff them out of the way.

Next, lets wire in your keyboard.
If you're using Eiffel or D.E.K.A, decide where to mount them, and run your wires as instructed.

If you're using a Mega keyboard and have a kit, mount and wire that in. If you don't have a kit, it's easy enough to build. All you need is a female 6 pin Cat 5 jack (Like used in ethernet cards or advanced phone systems) and wire. I don't have the pinout handy, but I'm sure you can find it by asking here, or looking for a DIY. If you can't find that special plug like on the origonal keyboard, it's no big deal. Just use pin connectors for the individual wires and slip them on pin by pin, or just solder them. Mount the bits in place and plug in your Mega keyboard.

Another keyboard option to save the cost of buying another keyboard is to put your origonal falcon case back together with the origonal keyboard inside, and run any type of wiring you like. Wire it directly or use any kind of 6 pin connectors you like.

Now all that's left is to extend your MIDI, Cartridge, and JagPad ports.
If you don't use any of these, forget them till need be :)

The easy way requires no soldering, no cutting....

MIDI: Purchase a set of extension cables from any music or computer store (male on one end, female on the other...or male male with a barrel converter...or just use nice long cables direct to your MIDI device), find an opening or drill one and run the cables inside and plug them in.

JagPads: Same approach as the MIDI ports. Find a nice opening or make one. Run the cables inside, plug them in, and forget it.

Cartridge Port: No dongles? Forget it till you need it. If you've one dongle/device...and there's room in the case....plug it in and forget it. More than one...order a CartRight from Wizztronics and extend the port to where you'd like it.

The fancy way....
Buy the bits you need at an electronics shop. Design and mount the bits in the case as you'd like them. Connect it all up pin for pin as it is on the Falcon.

Hope this helps:

Brian

It is which ever RJ jack has 6 pins. Just like in ethernet and more advanced
phone systems.

The Falcon's Floppy and connecting cable is a regular one, so any PC type High Density Floppy should work fine. You might need to change a jumper or two but the drive itself should be no problem. You might run into some of the newest/cheapest floppy drives that don't like oddball Atari formats like old Doubtle Density disks, Twister, or extended formats (extra tracks/sectors). It is unlikely you'll run into any problems like this...if you do...just exchange back your origonal floppy drive.

If your tower case came with a long Floppy drive cable, that's great, you can use it. If not, you should be able to pick one up for cheap at a electronics-computer shop, or on Ebay. It's just a standard Floppy drive cable for PC.

Since you are ordering a CT060....
You might want to consider building an Eiffel.
This will allow you to use PS/2 keyboards and mice (even those with extra buttons, wheels, etc). It also lets you run power-savers and temperature gauges/controls should you install a variable speed fan or fancy cooling system. Eiffel software lets you program keys and mouse wheels and such as that.

I've not looked at the schematics for these boards, but I'm assuming it's a fairly simple schematic where you could use a general PCB or breadboard and wire it up rather than trying to etch your own PCB. It's a freeware project for the plans and software bits. So it's just the cost of your time and the parts you'd order.

There was at least one gentleman (Lyndon Amsdon) who would make these boards for you on order, but I hear he's looking for someone to take the project over and will not be making anymore due to a new full time job. You might ask him anyway, in case he has some extras set aside. At the least, he might sell you all the parts you need and save you the trouble of having to find them, look them up-cross reference between brands and all that confusing stuff when it comes to ordering parts to us non electronics wizards.

He also built EtherNEC boards. These are nice, and worth having if you're on a Cable or ADSL service! I have one an can attest that Lyndon does a fine job building them. With quality parts. My order made it across the Atlantic in very reasonable time, without a single hitch.

Check out his website and see.
http://hardware.atari.org/mine/index.htm

In the meantime, you might just wire in your existing keyboard as you check out your prices and options.

Brian

Well actually theyre different but you can use either the RJ45 (Cat5) or the
RJ11/12 sockets. I used a Cat5 socket on a modular hood that would have
normally been connected to a DB25 plug/socket. I just took the socket
assembly out of the hood.

The jumper you will need to change is usually labelled ds0, ds1 etc. Its not
usually present on modern floppy drives, but you may find a solder bridge
that will need changing, labelled the same.

The A drive end of a floppy cable in a PC is partially twisted to turn a PC
floppy drive (B) into (A). You will either need to find a straight thru
cable or a twin drive one and cut the unused connector off just after the
middle connector.

Coda.

If you know the correct pin connections and you already have a Mega keyboard you can use a two-line phone connector. I recased a MegaST and brought the keyboard plug out to the back of the case using the two-line phone connector. You'd have to pick the right pinouts as mentioned in a message above.

Hey Brian,

I've got all the screws out but one....it's one that secures the floppy and the screw goes through not only the mb but also what I guess is the scsi controller card?
The screw won't loosen up in order to pull it out of the case, and I'm afraid to exert downward pressure because I might slip and damage that scsi controller.

So, what should I do?

Thanks

I made the cardboard replica of the Falcon's mb.....the drive bays of the tower case won't even let that fit. I suppose I could pop the rivets on the drive bay asssembly, and try to fit some other assembly in. But then how would I connect it to the case? I've never put rivets on anything and don't even know what tools are needed.

Thanks,
Sam F.

At this point, the best advice I can offer is be creative and muddle your way
through it, solving each challenge one by one.

Take a close look at your drive bay assembly.
Does it look like you can cut out an L shape near the backplane so the Falcon
can fit under it.....and still have enough depth in the bays for mounting
devices? Chances are you can.

As for rivits...you can always use bolts instead, or get a rivit tool at you
your hardware store. Personally, I'd just go with screws and lockwashers...make
sure they're nice and tight so you don't get annoying rattles when it's all back
together.

Heh.

I never even thought of this. I butchered the crap out of my (really
tall) tower case to get my falcon MB to fit. Part of the problem was
getting the MB in and out rather than having it fit period. I had to cut
a serious amount of metal out of the center support structures. But I had
fun ;) Still my case job is fairly poor. Not that I have a dremel and
all the bits I could need, I would like to buy a nice antec case and redo
the whole thing properly.

Ah, right! 0.961 is a cul-de-sac then. Dunno why but I've always wondered what caused Newsie to stomp on disks. Has anyone tried with gcc? Might open up the code to more people.

> the box with LattiCe.

Just discovered that myself albeit via a convoluted fashion (found a LattiCe in a MagiC_PC archive and ran it under Wine in Debian). Doesn't run too well though but obviously under such circumstances no sensible conclusions can be drawn. Dunno how old that archive must be but it had STiK v1 installed!

I don't suppose there's a 68k cross-gcc 3.x to be had is there? I had 2.9x built for FreeBSD but lost the lot with a disk failure. I don't have the time to reinvent my patches to the patches that got it all going: yeah I did back it all up but the dratted CD went bad, 10 of them actually. All same batch. One week they worked. Next week they didn't.

Hi Mark,

Here's a question. The Falcon mb is attached to a metal tray. The tower case back plane has about 10 of those standoffs on it. Each of those is about oh, a 1/4" tall.

Do I really need those standoffs since the Falcon is already shielded? If not, then I should be able to gain about a 1/4" of space.

The total interior witdth of the tower case is only 6 1/4". The back plane is almost even with the 5 1'4" drive bays.

Maybe I should just buy another case.
Something that's certainly a bit more roomy.

Thanks
Sam F.

> then I should be able to gain about a 1/4" of space.

You don't have to use the standoffs, no.
As long as you are confident the circutry on the underside of the Falcon mb
isn't in danger of touching something and shorting.

The stand-offs were to get the mb at the most appropriate height for cutting out
your ports.
I didn't realize you'd be so short on space from tower front to tower back.

Out of courious ity I was searching ebay the other day....looked like a lot of
really nice cases about for well under $20. Often brand new ones. You might
measure and compare just for kicks. Also check pawn shops, computer shops, junk
yards, and yard sales ;)

Maybe the full server tower on wheels is what the Dr. Ordered?

If the fit is too tight, then I will get another case. At first I was thinking of cutting the 5 1/4" drive bay cage to a smaller size, but then I realized that the slot for the floppy is low, and the floppy bay attaches to the bottom of the 5 1/4 bay cage.

Oh well, let's see what happens when I remove the standoffs.

Thanks

>
> Aaaaaaaaaaarrrrrrrrrrrrrrgggggggggggggghhhhhhhhh!!!!!!!!!!!!!!!!!!!!

I'm in Tucson, AZ. A little far from you, but if there's any way I can calm your fears, I'd be glad to help. I've had two Falcons, one of which I've re-cased, both of which I've had to take apart - one to add an FPU, the other to first add a PC power supply (because the original died), then repair a mistake I made doing the power supply switch (blew out a transistor because I was told the PC power supply colors should be the same as the Atari's - but they're not), and finally to recase the whole thing. So I've got a little experience around the Falcon mb.

The biggest things to remember:

1. Don't be afraid to remove anything that's not directly attached to the motherboard (either soldered or wired to it). As long as the motherboard and its soldered-on components are intact, you've got the floppy drive attached properly, and it has proper power connection, either through the Falcon's power cable port or through a CT60 power connector, the computer will work fine, even completely outside of a case.

2. When removing any cables (like the keyboard or floppy, for example), just write down exactly where it was you removed it from, which color wires went to which pins (if colored differently), and which direction the cable was oriented. Maybe even mark on the plastic connector with a marker which direction was the front, back, left, or right of the motherboard. That way you won't have any confusion when re-assembling it.

3. Make sure, before coming in contact with any part of the machine's innards, that you discharge any static electricity you might be carrying. Touching anything that is metal and grounded will work.

4. Relax, have fun, take it slow, and ask lots of questions.

Good luck! If you have any more specific questions, please feel free to send an e-mail at the address below (don't reply to the e-mail address that this is posted with, as it is one I've set up to catch spam, and do not read).

My previous st was a 1040STf that I really haven't done
much with in 10 years. Now I just received a Mega STe with
4 megs of RAM and am raring to try out a few things, but
I'm a little behind the times. I've got a few questions:

1. Was there a language diskette or anything for the Mega STe?

2. I want to put it on my home network through my Portmaster. Since
I can do SLIP or PPP connections, what software should I download?

3. In combination with 2, I think I want to try out Mint on it,
which, IIRC, I can try out with Easymint. Is this correct?

4. Once I get networking setup, what's the best way to backup
and restore the hard drive? I figure I will be a lot more brave
if I can just dump my hard drive onto my Linux server (200GB can
store a lot of copies of my 44MB drive).

Thanks!

3677. PLEASE, HELP! Troubles with booting ST from hard disk (my fault)

Newsgroup: comp.sys.atari.st
Date: 2004-06-10 22:31:44 UTC
From: Łukasz Maśko <ed@yen.ipipan.waw.pl>
Message-ID: <caanh7$3bs$1@mamut1.aster.pl>
Source record: 18272

Hello.
First I must say, that I'm a lame as far as Atari STs are concerned.

I've recently bought a Mega 2 ST and SH205 hard disk. Everything worked fine
until today. I've tried to make terradesk run during startup, so I've put
it and some of its files (maybe not all required) to c:\auto\ folder. After
reboot the computer reads AHDI driver, reads something and then reboots.
And it is like this forever. I've managed to notice 2 bombs just a fraction
of a second before reboot.
Can anyone help me with this problem? Is there a way to boot baypassing
files stored in AUTO directory completly? I know, that I can press
Alternate during startup to avoid booting from disk. But then the hard disk
driver is not loaded and I have no access to my partitions. Unfortunately,
I've noticed that in such case the computer somehow isn't booted from the
floppy too. What can I do in this case?

Thanks in advance.

First try holding various keys and combinations while booting.
It's been a long time since I've used those drivers, but I'm thinking there is a way to boot the HD but skip the auto folder. Try things like ctrl. alt + ctrl. shift, and so on. You might stumble upon a combination that works.

Otherwise...I assume your disk drivers are AHDI. If supra, ICD, or something else the following still applies, just substitute the driver in question to the auto folder of a floppy.

Find your HD utility disk on floppy. If you don't have one, make one. You can find the latest Atari Hard Disk (AHDI) drivers at most Atari FTP sites. Put the ahdi.prg in the auto folder of a floppy. Insert the floppy. Boot holding alt.

If for some reason the ahdi.prg doesn't from from the auto folder on the floppy...no big deal, just open it and double click it. The utility will run and mount the drives.
Next you'll have to use the desktop 'install drive' to add at least the C drive disk icon to the desktop. Be sure to type the capital C for the device name (small c means cartridge port).

Now go into auto folder and move Tara desk and all its files a folder of its own.
Reread the instructions ;)

To have Taradesk auto install on a Mega ST with TOS 1.2 you should tell the desktop to launch it. I'm not sure which is the earliest TOS that supports this auto start feature, but it is done with a line in the DESKTOP.INF file if yours supports it. If not, you use a little application called startgem.prg or similar in the auto-folder.

Hope this helps,
Brian

I've tried this. Without success.

Yeah. That was the point. I've tried to do exactly this myself before. But I
was typing small 'c' all the time. How could I guess being such a lame ;-)
But now it is fine again. Thanks a lot.

I have TOS 1.04, so I must use something like startgem.prg. I didn't find it
yet anywhere to download (tried using google). I'll keep looking for it.
Thanks again.

TOS 1.04/1.4 was the first to support auto-loading GEM programs
natively.

>>If not, you use a little application called startgem.prg or
>> similar in the auto-folder.
>I have TOS 1.04, so I must use something like startgem.prg. I didn't find it

>Thanks again.

Since you have TOS 1.04, or 1.4 depending on who you ask, you already
has this ability and don't need STARTGEM.PRG. Single-click on the
TERADESK.PRG icon and, under the Options menu, click Install
Application. Set the Boot Status to Auto and click Install/press return.
Save the desktop and TERADESK should auto-load when you next boot.

Bonjour :)

Le pseudo demos program pack called VDI_FX (pure VDI calls) has been
updated. Download on my homepage or directly on:
http://rajah.atari.org/files/ -> vdi_fx.zip (290Kb)

News:

+ Stars: up to 6000 stars that can be displayed
+ Fixes for windows borders (MagiC 6 windframe)
+ New effect: 'Souvenir of the Beast' (STOB)
-> need a least 256 colors or more
written from a Amiga Blitz Basic source.
It's slow on normal Falcon, but should be smart with Hades, Milan,
FalconCT2 or FalconCT60. TTRAM is used for offscreen blittings.

Have fun :)

[replying to self]

Just compiled aranym. Problem is no STiK or equivilent. Does any one have
any tips on how to proceed? Basically this machine is (atm) debian sat
behind a FreeBSD box. Some sort of pseudo ethernet I guess that just pumps
stuff in/out to underlying debian.

TIA

Try steem (steem.atari.org) or StonX (stonx.sourceforge.net). I've tried both (only under linux, though); they come with documentation and readmes and work pretty well.

Cheers

Bonsoir :)

Dan A a ï¿½crit :
> Nice Work!

Thanks :)

> So was the porting of Blitz Basic to GFA Basic complex?

No. This was very readable / understandable. But all must be
rewritten for GEM ;)

Please note that i have updated this archive this afternoon: my TC mode
on my Eclipse/ATI Rage II is buggy and made my code false. The sprites
were white on Falcon TC Videl mode. So i had to put some changes.
If you see the line SOTB_TRUE_COLOR_FOR_ECLIPSE in the VDI_FX.INF, you
have the correct SOTB.PRG and archive.

Sam,

When I went to these, I simply looked around for the absolute largest (tallest) case that I could find and it mostly worked out (with some cutting). You'd probably benefit from making a cardboard template of the motherboard and bringing it along for fitting while at the show. Most vendors dont' seem to mind stuff like that.

From: vdjole@EUnet.yu
Message-ID: <cadaq3eom1@news.eunet.yu>
Source record: 18287

Version 3.32 of Tera Desktop (TeraDesk) is available at:

http:\\solair.eunet.yu\~vdjole\teradesk.htm

This is a bug-fix release. An unpleasant bug was found and fixed, related
to memory allocation when composing the ARGV string. It could lead to
errors or intermittent crashes when launching (or ending) programs.

Several other (rather unlikely to manifest) bugs have been fixed as well.

Have fun.

Some great places to start looking:
http://steem.atari.st
http://aranym.sourceforge.net/index.html
http://www.atari.st/
http://www.atari.org

Steem is very good. I highly suggest grabbing this one first for a number of reasons.
1. It offers good emulation.
2. Built into it are LOTS of valid links for places to get software and utilities (will save you alot of 'searching'.
3. This one works with MIDI, has some good extended resolutions, is quite fast, AND has a really nice user interface.

Once you get this...use links it offers in the info section to find you TOS-Images.
Next you'll likely want to find some disk image utilities, which STeem's links will also help you find. GEM Explorer is a great thing to have if you've alot of older Atari disks that you PC can't read. Again, STeem's link section will help you find it easily.

Brian

3695. Demon ISP question

Newsgroup: comp.sys.atari.st
Date: 2004-06-11 23:14:01 UTC
From: cstanley@zetnet.co.uk
Message-ID: <40ca3cb8$0$22315$4c56ba96@master.news.zetnet.net>
Source record: 18290

Hi Atarians,

A friend asked me why is Demon ISP called Demon: he objected to the unchristian name. I thought I knew, but I don't. Anyone know, please?

My only contact with Demon was when I first tried to subscribe to it and got a snooty answer that they "didn't do Atari". I shortly found a local ISP in Wintermute (Aberdeen, Scotland), a friendly but PC centred lot who helped me get internetted, until they went too business orientated and became impossible for our system. Then I discovered Zetnet. Hurrah for Zetnet, folks :)

BTW, whatever was the outcome of the court case between Zetnet and the other Shetland site? All reporting of it seems to have petered out.

Charles.

Check out the Aranym docs. There's details on how to setup the Aranym
pass-thru ethernet support. Things are very sensitive on the Atari side
though. IIRC you need a 1.16a MiNT kernel and some other stuff to get it
setup right. I spent a lot of time getting my Aranym system running
perfectly, but now that it's convoluted with my commercial software lot, I
can't send it to you easily without just deleting all of that in a copy.
I recommend the easymint under aranym installation instructions by Arnaud.
Look on the Aranym site. Also check mailing list archives for questions. ;-)

HW 0.2.0 (030-binary) runs happily with FreeMiNT+XaAES on my CT60.
Do you get an error also if you try HW in 030-mode? Did you setup cache
settings in the highwire.cnf? And also, did previous HW releases work
out alright on your setup?

Newsgroup: comp.sys.atari.st
Date: 2004-06-12 09:03:10 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1gf9k28.g87ff41gbmfi8N%NOSPAMS@wanadoo.fr>
Source record: 18295

Hi,

After 20 months without new version for differents causes (CT60, eiffel, Linux, etc...), the lastest version Aniplayer 2.22 is available on my site http://aniplay.atari.org

The best of the new features are:

- mp4 reading (mpeg 4).
- codec sorenson video 3.
- more options for divx.
- search functions inside the Playlist.
- all SLB recompiled with Gcc 3.3 for the 68060 (faster when the FPU is used).

TO DO (next update):
Better synchro between mpeg audio / divx/mpeg (DSP buffer creates pauses).

For more infos:

http://perso.wanadoo.fr/didierm/doc/eng/c_0b.htm

Now, Aniplayer is a freeware.

Regards,

Didier.

It worked for a little longer in 030 mode, then locked the
system without an error. When I tried again I got the 68000
exception. The cache is setup, and previous releases work fine. I
also tried with minimal acc, auto programs and cpx's loaded; same
problem.

Thanks!

Nice Pierre! I will use this occasion to point on a "bug" in TROLL and probablly in all your code ;) PLEASE, make it ext2 fs (or any unix fs) compatible. It is VERY easy. Just change all your hardcoded paths to lower case and that is. Uppercase should not be used in code. If filenames and paths are lowercase in code, they are converted in uppercase on TOS file system automaticaly, and on unix fs it will stay lowercase and thus avoid "cant find rsc, etc" problems, since when u copy/install app to unix fs, lowercase is default.

I sent u couple of mails, which bounced, so i asked this in public :) But i do like TROLL, and also use it. Since there are filters, im back to Atari for news and stuff :)

I don't like using lower case (will not be 'beautiful' on my MagiC
+ VFAT) but okay, i'll correct it for the next release.
Please be patient (at least a month), coz i'm feeling a little
depressed (too much code, need some rest).

> Please be patient (at least a month), coz i'm feeling a little
> depressed (too much code, need some rest).

U can use own cases for configuration files and files created by TROLL. Like "TroLL.cfg" etc. Those are created by 1st running of the program. But lowercase is the safest way. Lowercase is "ordered" mostly for system files like *.rsc and such!

No problem, take your time :))

> Good to hear it. Thanks for using my program :)

No problem! It is nice behaving app, need some polish, but its still early versions and already usable, so niceness may come later :) Thx for nice work!

regards Janez

I had a similar problem, probably caused by the same bug: Newsie froze
completely upon an attempt to open ABOUT...

This appeared after I entered the registration number obtained from
the author. After some experimenting, I found out that any registration
number greater than 32767 caused a freeze.

If you think this might be the cause of your problem as well, edit the
PREFS.INF file; if the entry registration_number has a value too large,
enter some lower value. 32000 works fine for me.

Btw. this problem exists in V0.961 too.

Bbtw. I remember reporting this to the author back then, but there was no
reaction at all.

Excellent Didier.

Yesterday I was sent a url to a movie of some idiots playing with
fireworks Jacakass style. Yesterday it didn't play properly, today
it does. Round of Applause, take a bow.

Aniplayer didn't recognise the mp4a sound format though. Also the
image still freezes when enlarged to 2x size (NAES 1.2)

What is the IVorbis slb for ? I am sure I saw it in the docs but
later I couldn't find it.

Thanks for the mention in the version history ;-)

Regards,

Peter

I tried under Mint with 256 colours without any luck but managed to
get it running under TOS albeit rather sluggishly. It's obviously
not a problem with the version of the game that I have.

It got as far as the code key screen and I could key in the code but
couldn't get the Enter key to work.

I will try your suggestion of using the American keyless version if
I can find one.

Regards,

Peter

3727. STe on the way - ethernet?

Newsgroup: comp.sys.atari.st
Date: 2004-06-13 20:17:36 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <2j3r33Ftfm9tU1@uni-berlin.de>
Source record: 18222

Hi.

After a sudden rush to the head, I now have an STe on its way from eBay (last had an ST about twelve years ago). I'm in interested in connecting this up to an ethernet network, preferably not by using the DMA port that I might press in to action with a hard drive at some point. If possible, I'm also potentially interested in using this with alternative operating systems (MiNT, NetBSD?). And as this is just a fun sideline, it can't cost a great deal of money either.

All suggestions appreciated.

Cheers,
Ian

Hi everybody,

Apologies if this is an FAQ - I couldn't see an accurate answer there....

I have three STs - a Falcon, which works perfectly, a 520STfm which also works perfectly using a monitor socket->SCART adapter, and a 520ST which doesn't. :)

That is to say, the ST works fine, I can boot up Rana Rama or Dungeon Master and I can hear the right noises. However, I get no video whatsoever.

Looking at the pinouts for your average SCART adapter, the lead assumes a composite signal on pin 2, whereas the ST happily outputs ground on this pin. Even when I tell the TV to use RGB blanking by setting the RGB switching pin 16 high, the TV switches to RGB but still nothing. I can see by using my multimeter that the ST is outputting an RGB signal, though, so I'm guessing the sync signal is not getting through or something.

I was therefore wondering if anyone knows how to get any kind of picture out of this ST without buying a monitor - which I really don't have space for! I don`t want to modify the ST itself, as it's a nice early model in good nick (Serial #1000607, May 1985).. but cable building is of course fine!

Thanks for any help!

There's a simple answer to this situation. The pin that has composite
video going out is blank unless the ST has an m as in the modulator. So
you need either an STe, STm or STfm. You really have to buy a monitor...
unfortunately. I've looked into this myself because I have a couple STf's.

As far as I know there is not problem in mixing an HD and a Ethernet on
the DMA. You might also look at putting IDE drives on. I am not sure about
the statud of the interfaces though.

Which STe?
Who much memory?

If GEM is important to you...I recommend Geneva for the ST Class for low memory and best all around compatablility. Use the desktop of your choice with Geneva. While NeoDesk is rather nice...if you're going to buy one, Thing or Jinee are much more up to date and well rounded. TaraDesk is free and might fit your needs.
As far as an AES goes...Geneva looks great, is very fast, and you won't find many, if any applications that won't run under it (there are all kinds of compatability flags that can be set...even one that freezes all other apps and puts you in single tasking mode if need be).

MagiC is also a good choice for these reasons:
1. It's a bit faster than TOS, and includes preemtive multitasking.
2. When teamed up with HDDriver 8 you get background DMA disk access. Support for more disk partition types, larger partitions, more partitions, and long file names (vfat).
These are the big PLUS factors for MagiC.

MiNT...
The latest and most modern mint kernels are NOT geared for the ST class of machines. They require a good deal of memory (and often 020 or better w/FPU) in order to have all the bits that make MiNT great in the first place. The bits are free however, and with paitence and luck, you might be able to piece together a setup with just the right kernel and AES to get a useable setup.
With this in mind, you might start with the KGME/KEMD installation. Go with a minix rather than an ext2 partition. The catch here is...I'm not sure if older kernels will handle the Mint-Net version and drivers for Enec ethernet boards.
As you get into the later kernels that without doubt will...they hog up more and more memory, not leaving much room for any GEM AES and applications to run.
BTW: Geneva will plug onto MiNT as a preemtive AES. You might need NoHOG.ACC, and more modern AES calls may not be present.

You might try this first since it's free.
For starters, IGNORE MiNT-Net and minix or ext2....just get the kernel and AES going. In this way you should have memory left to use GEM well.
Grab the latest XXAES distribution.
Grab the latest Tera Desk distribution.
Start with older/smaller MiNT kernels for 68000 and work your way newer till you find one that boots the Moose mouse driver without complaints.
Gradually build a MINT and AES cnf file till you get one that happily loads XXAES and TaraDesk. See what kind of memory you have left...might be useable this way!

You can make up a composite video from the RGB and horizontal sync and
vertical sync outputs. The circuit requires 5 resistors, 2 diodes
(OA90/OA91 or 1N914 should do) and a little soldering to build, but
should[0] work. An image of the circuit is available at:

<URL:http://www.my-ste.demon.co.uk/images/composite-video.gif>

[0] Not tested by me, but should work. It's a minor modification to one
I used for the A3010 when connecting it to an old monitor that required
a composite video input. Since the A3010 can supply a composite sync, I
modified the circuit to combine the horizontal sync and vertical sync so
as to generate the composite sync.

Regards,
David Bolt

Hum...will such a cable give a color picture or just a black and white
one? I remember reading an article about such a cable too and it said it
produced a greyscale pictures for old monitors. (ofcourse not in
ST-HIGH but ST-LOW and ST-MED)
Another questions is if that would work with the composite input found
on tv cards and how is the quality in general compared to a cheap TV
connected via HF modulator?

cheers,
Matthias

Thanks - been a long while since I looked at anything ST'ish and I don't recall the name Geneva. I do remember that I used to use Neodesk though.

> MagiC is also a good choice for these reasons:

Thanks for the warning - MiNT was on my list to try, but if it requires a 68020 I'm not sure it's what I'm after.

Anyone tried NetBSD by the way? I believe it's possible to run that on the ST, but I'm not at all sure about how I'd hook things up to an ethernet network if I took that route - don't know adaptors are supported.

Cheers,
Ian

Ian:

http://www.howell1964.freeserve.co.uk/SCART/scart.htm

http://homepage.ntlworld.com/kryten_droid/Atari/ST/spg/st_prog_guide_1.htm
says that the video output is 1V pk-pk through 75R, so you may not need
level shifters as mentioned in:
http://www.howell1964.freeserve.co.uk/Atari/ST/Atari_ST_Video.htm
I'd want to check the ST circuit diagram to verify this though.

> composite signal on pin 2, whereas the ST happily outputs ground on this
pin.

Sounds like a fault in that output.
Even in RGB mode, the TV needs this signal for its sync pulse.

> Even when I tell the TV to use RGB blanking by setting the RGB switching
pin
> 16 high, the TV switches to RGB but still nothing.

Pin 16 is the 'fast blanking' signal which should be 2V.
It has 75R impedance, so you can connect it to the 12V rail through a 750R
resistor.

Pin 8 is the 'control voltage which may need pulling up to 9.5V...12V to
select AV mode.

> multimeter that the ST is outputting an RGB signal, though, so I'm
guessing
> the sync signal is not getting through or something.

> > <URL:http://www.my-ste.demon.co.uk/images/composite-video.gif>

This will only give you greyscale of course.

> Another questions is if that would work with the composite input found
> on TV cards

I sent the s-video from my 800XL to my PC TV card and found the image was
not as good as s-video on my TV.
Somehow, the intensity and colour wasn't as deep.

> and how is the quality in general compared to a cheap TV
> connected via RF modulator?

RF can only make things worse, but even cheap TVs have video inputs these
days.
Unless it is a really cheap TV, which is probably going to be poor quality
anyway.

How about a wild guess? Daemon is a unix term for a small program that
does something useful, and does it well. A dialup shell is a small program
that does something useful, and does it well.

So they run some daemons on their unix box, and spell it demon for those
who do not speak unix.

Jim

>Hello All,

i guess it will be extremely hard to find cartridge port extender, i suggest you just leave as is...
joystick and mouse ports should be something like d-sub 9 pin, while paddle ports (a and b) will also be hard to find...
there is no case which is 100% ok and maybe you should leave it as is?
i managed to install 3.5" IDE drive, CT60, keyboard rj-11 jack and 3 additional fans in regualr falcon"s case :)

and this seemed easier to me ;)

one of the reasons is trouble free web browsing without pop-ups and viruses (and I mean 100% one, not norton or mcafee 75%)...
:)

and falcon+dat still sound better than any pc card worth as both of them :)

Have you ever tried an Atari Falcon for that purpose? Very nice! I
have an Atari Falcon, running Cubase Audio (for multi-track CD-quality
digital audio recording, MIDI sequencing, Scoring, etc.), connected to
a few Roland keyboards/MIDI modules here at my home studio. I actually
haven't done as much with it as I'd like, due to time, but ultimately,
it is able to record, mix down tracks into files, and then burn the
files to an audio or data CD, including MP3. Probably not quite as
in-depth in features as your PC, but not a bad system at all for the
purpose. That's what it was actually designed for. It has a built-in
(on-the-motherboard) Motorola digital signal processor, a direct
digital port for connecting anything from external syncs (i.e. SMPTE)
to 24-bit digital multi-channel input/output ports, CD/DAT-quality
audio, 16-bit analog audio in/out (mic/speaker) ports, and of course
built-in MIDI ports.

> so how is the atari scene these days? how is the hades, the milan etc

Hades/Milan aren't currently in production, as far as I know. They
wouldn't be as great of music machines as the Falcon is, if that's
what you're looking for. Also, if you get a Falcon, there is an
upgrade card called a CT60, which makes the Falcon faster than the
Hades or Milan, anyway. I hope to be able to get one soon, if finances
shape up a little here. You can also get other upgrades, such as a
graphics card (Nova, Eclipse, or the upcoming SuperVidel, which
requires a CT60 to run), or add a CD-ROM, CD-R, CD-RW, or DVD-ROM
drive (can't read DVD video yet, but can read data DVD-R's).

There's excellent software available for most of your average needs
(document processing, database, spreadsheet, graphics processing,
etc.), as well as some specialized tasks. One of the more limited
areas is in web browsing. There are a bunch of web browsers, but
they're not quite up to "modern" specs yet. They're getting better,
though. Other internet software is very well covered, though.

As for OS's, there's a number of OS combinations to choose from:

1. You can stick with TOS and either use its native GEM GUI, or layer on top of it Geneva (adds multitasking and a more configurable look, while being very backward-compatible), or the new MyAES (not quite complete yet, but very nice looking).

2. You can get Mint, which is a Unix based OS (like MacOS X is, only this was done almost 10 years before Apple came up with the idea). On top of that, you can use a text-based CLI, Atari's AES 4.0 or 4.1 (which is basically a multitasking GEM), Geneva (not quite as stable as with TOS as its base), N.AES, XaAES, OAESis, or MyAES. Each has its own unique look and features, but all rely on the powerful Unix base of Mint, letting you run both Atari software as well as Unix software, including X Window software, with an X Server.

3. You can use Magic, which doesn't have the core Unix power of Mint, but has a very nice GUI included with it, that outshines all the others in my opinion (although if MyAES gets more completed, it might rival it). You can either use its main GUI, or MyAES.

4. On top of any of the above, you can run just about any desktop you'd like, each giving you different combinations of features.

This is the main reason why I prefer using an Atari over PC or Mac. It lets you be much more creative, right down to how the OS itself operates!

If you really liked the Atari and want to do a little experiment, go to http://aranym.sourceforge.net/ for the newest emulator for Linux, Windows, and MacOS X (although the people behind it scoff at the word "emulator"), which runs quite well. It can be difficult to set up, but on decent machines, it runs quite fast! If you install Aranym and AFROS (Atari FRee OS), you will get a *very* basic Mint/XaAES/Teradesk setup, which is ok, but not the best, in my opinion. But it's free, so you can't complain! I only wish they'd give you more than 4MB on the bootup disk image in AFROS, or give you some easy way of extending it.

Look around at www.atari.org or www.atari-users.net, for info and current news.

> why on earth are you still using ataris, i'd be genuinely interested to know
> what they're up to!

I use mine for just about everything. I *much* prefer using my Falcon to using my Mac at home, or my Windows PC at work. I use my Mac primarily for Web browsing and digital image processing (my Falcon doesn't have a USB port, which my digital camera needs to connect with). Otherwise, I use my Falcon for just about everything else! Music, document processing, games (I like the classic games best, anyway, so why not use a classic machine?), some internet stuff, etc. I does the job quite well, and is *much* more enjoyable to use. Besides, I like the look people get when they find out I did my work on an Atari, as most of them think Atari just made video games.

3749. Re: Atari 520ST SCART

Newsgroup: comp.sys.atari.st
Date: 2004-06-14 20:23:08 UTC
From: Tom McEwan <captaininsanity@ONAYAMSPAYuk2.co.uk>
Message-ID: <cal1i0$61i$1@newsg3.svr.pol.co.uk>
Source record: 18244

I've had an STF (no modulator) hooked up and working fine on a TV scart input using RGB. It's been a while, but I think that all I did was use two diodes and a pull up/down (forget which) resistor to combine the horizontal and vertical synch signals on the Atari port into a composite synch signal, which was then input to the TV via the scart connector along with ground, the three RGB signals, and the audio signal (had to split it to drive both the stereo input pins on the TV).

One thing you do have to look out for, however, is some TV manufacturers cut corners on scart ports sometimes, making them able to accept composite video but not RGB - on my own TV (a panasonic) one of the scart ports does composite video only, the other does composite and RGB.

It's been a while, but I do recall that by using diodes to add the two separate synch signals, one can quite easily generate a composite synch signal - a quick look at the port with an oscilloscope should indicate how they need to be combined.

Tom

There is a piece of hardware for the ST called "Video Key" which
allows a ST to be hooked up to a TV.

I would do that and copy the info onto a CD (if you have the right
software and hardware). I do that now, but I use to store
everything on a 1gig Jaz cart.

>Thanks in advance.

When this happens to me, I just boot the computer and hard drive
from a floppy. Then go into the Auto folder of the C parttion and
remove the files causing the program and then start over. It looks
like some other program/process is interfering with TerraDesk. I
would just try booting the computer with just TerraDesk in the
auto folder and then adds things a littler at a time. It could
also be the order in which things are booting. Adjusting boot
order always seems to solve a lot of booting problems for me.

Oh, if that is the case then you are correct Joe. Ethernet would
be the way to go. I also have a cable that works through the
printer ports that works fine for file transfer. Of course for
file transfer, the best thing is an ethernet setup using the ftp
protacol.

Midi.

For the cartridge port:
Cartright Cable (Wizztronics). If they're out, try other places and ask for an ST ROM port extension cable. These are not easy to make on your own unless you etch PCBs on a regular basis! The alternative would be to desolder/cut off the origonal ROM port and wire it back up with ribbon cable (risky!).

Jag Pads:
I'm not sure what those ports a called exactly. I think it's pretty common stuff, I.E. you might see identical connectors on other games consoles like Sega, Nentento, Sony, etc...
Take a close look at it...maybe even take a jag pad with you and hit for favorite game console shop. You could also contact Atari shops and ask them for Jag Pad extension cables.

Normal joystick/mouse ports:
If you're going with a Mega keyboard or the origonal Falcon keyboard....the joysticks are part that already. Eiffel and D.E.K.A both have provisions built in for your joysticks.
Also, if you want normal joystick/mouse extension cables...any Atari shop can surely help you.

I noticed a WaCom Graphics Tablet driver for PixArt as I was browsing the net the other day. The docs are not English so I couldn't make out details about the driver.
What I'm wondering is.....

What tablets should work with this?
Would any of the WaCom serial tablets work or is it just one or two specific models?
Should it be the mac type or the PC type, or is there even a difference other than the pin-outs of the serial connectors? Also the things come in lots of different sizes....

Thanks,
Brian

I'm afraid the cartridge port is going to be rather difficult to extend. This is one of the reasons I opted for the orientation of my re-casing job. I popped off the back panel of a mid-tower, and oriented the motherboard so that what was the front edge is now on the bottom, and the left edge (with the cartridge, jag pad, and MIDI ports) hangs out the back. I plan on making extenders for the rest of the ports, and making an extension of the back of the case that I can remount the original back (remodeled to allow access to the cartridge, jag pad, and MIDI ports) onto the case, completely enclosing it, and mounting the rest of the ports wherever they'll fit. I believe I've found places for all of them on this case.

Mike Freeman
mike [at] freeman-studio [dot] com

For the other ports, however, it should be fairly easy to get male and female connectors of each type at a really good, comprehensive electronics parts store, or online. Then you just need to solder cabling to each, making sure the final result connects the right pins to the right pins. If you can get shielded cabling, that'd be best, to reduce any electronic interference, and keep them as short as possible.

It may be that its just for the Wacom artpad (rebadged and sold in other names), the small one about the size of a mousemat. I have one of these, its serial connection and the drivers are available for PC and Atari, and possibly Mac too, though I never could get the Atari drivers to work with it.

As far as the docs are concerned, how about translating them on babelfish?

Coda.

not the Midi.
>

The cartridge port requires and edge connector although I can't recall the number of ways it needs to be at the moment (just count them) any good electronic outlet should stock them. I suggest you try and find a panel mounting one, as for extending from the mother board probably best way is to try and find an old cartrtidge that has a through connection (allows another cartridge to be pluged into it), remove the case and components (marking which end is which) solder wires to the connections at output end which you then run off to your panel mounted connector and plug the correct end into your cartridge port.

JagPad/Enhanced Joystick ports, the use 15 way high density D connectors your should be able to purchase both plugs and sockets. If you line the connectors up with the solder ends facing eachother it's a simple wiring job as it is a one to one connections, for example on the top row - left goes to left, right to right, center to center, inner left to inner left and inner right to inner right and repeat this on all three rows. I recommend starting with the middle of the three rows.
You should note however that with the wings on you cannot plug them in to the Falcon, you could try bending the wings back towards the solder connection but it is probably best to remove them all together. This can be done by drilling out the holes in the wings which will allow you to remove them but be carefull as the metal wings hold the whole thing together. After carefully removing the wings you should seperate thetwo plastic inner sections by a small amount (to far will let the pins fall out) and then squeeze a little model glue in between them, push them back together and if possible clamp them untill the glue dries. You may find the wings are usefull for holding/clamping the connector in place while soldering, if so solder then Falcon end first then remove the wings before soldering to the other connector, the wings of which can be used for mounting it to a panel.

Extending the Standard Joystick/Mouse ports is identical to extendinghte Jagpad port except the you require standard 9 pin D connectors.

MassInk Refillable Ink Cartridge for Epson Printer

How to control the flow of ink without foam?

Refillable Ink Cartridge. Big Savings on Inkjet Printing Costs! High Quality Ink! Fast Delivery! The regular cartridge have smog cases, our refillable cartridge have see through window. So you will never have to figure out how much ink you filled.Our Refillable Cartridge has a totally different structure and meterial used from a regular cartridge! The advantage of our new products is that it can hold large quantity of ink, and the printing will be in a fluent way, no leak as inside the cartridges without sponge, the quality is even better than the Origianl cartridges.

Also we can offer you OEM ink cartridges, welcome the large demanded business friends to contact us, and wish to contribute to your business greatly.

Close, but not quite: what makes it a daemon is the fact that it does
its thing in the background and does not hog a terminal.

Meaning you start it, it says "ok I'm running" or something, hands
back control of the terminal and keeps going.

Some daemons can get pretty big and some do a crappy job, too. ;)

Sorry to break your bubble, but my Netscape running under linux pretty much has that covered...not only that but I think many websites that are created with modern web technology in mind will be severely less functional if not unviewable with Atari based browsers...

> and falcon+dat still sound better than any pc card worth as both of them :)

Debateable...I can get a cheap PCI card using the Envy24 chip, that will make the DAT enhanced sound on Falcon sound positively crude. I use Linux preferably for Audio if that helps arrest your anger, but simply the hardware you refer to is not able to cut the mustard in the pro world of recording today...

Don't get me wrong...I still dig my Falcon (yes I still use it, although much of my Atari use is now with emulated GEM stuff using ARAnyM under linux, at a speed the original hardware cannot hope to match)...its just that advocacy (I still advocate for Atari) needs to done with a sense of reality...

> haven't done as much with it as I'd like, due to time,

Time is a key word...I have pretty much the same setup with my Falcon
and my Roland modules provide vastly better MIDI with my Falcon than
any internal wavetable can provide on a PCI card, but for around 1/4
the price I payed for my Falcon I'm running an AthlonXP 2500+, GeForce
FX5600 graphics, 19" monitor, 24-bit 96kHz sound, 512MB RAM, 40GB disk,
running Mandrake Linux 10.0 official (which God damn rocks!)...all of
which can complete tasks the Falcon is horribly slow at, or cannot do,
in about the time it takes sometimes to read this 'word'... :-)

A 12 year old design trying to cope with the multi-megabyte tasks
of today is just not feasible unless you are very patient, or love
nostalgia very much...I fire up my Falcon quite frequently just for
that reason, but I leave my POV-ray renders and other stuff to my
linux beastie...

> files to an audio or data CD, including MP3. Probably not quite as
> in-depth in features as your PC, but not a bad system at all for the
> purpose.

Mp3 on a Falcon is tedious...creating them is very slow, and playback
is limited by CPU grunt (or lack of)...lets face it the combo of an
030 + DSP was penned years before Mp3 was...

The Falcon impressed me in 1994 when I got it, but to advocate a machine
for Mp3, that struggles to play Mp3 at an acceptable quality is perhaps
a bit OTT...

The cartridge port? No, the eNEC comes with a cable that just plugs right in.
You simply mount the NEC board somewhere and you're set.

That just leaves the jag pads and midi ports right?
Personally, I'd just plug in extension cables and let them pigtail out of the
case.

Brian

hi!

the simle way, it's to cut a window in the background of the case:)
for all, scsi, sound, vga,dsp, RF......

After that find solutions for cartridge,midi, extend game pad, and
mouse, keyboard:)

for cartridge, another guy give you solution :the other post:)

For midi, the most simple is xls mic connector:)
In reality you need 3 connectors for midi:)

For game pad, mouse, keyboard : eiffel, the best open source solution!
With optimisation for CT60 TOO!

bye

You should immediately try to play MP3 files on your falcon with Aniplayer!
:-)

Even a stock falcon is capable of playing MP3 files with perfect quality
(although a standard falcon needs nearly 100% of its cpu time for that
purpose). If you have a CT60 however playing MP3 files only takes less than
10% of the cpu time so in practice you don't even recognize any speed loss
from MP3 playing for your other tasks like writing emails, reading news,
using a word processor or even when surfing the web with Highwire.

But of course you are right, when it comes to raw processor power like
raytracing, mp3 encoding, PGP or MPEG encoding a falcon even with CT60 shows
its age.

Regards,

Frank

Well, the latest Mint kernels do not -require- a 68020, but it is true
that they are completely impractical to run it on a ST-class machine-
except for trying out e.g. an AES or a desktop... Even without Mint,
the size of useful Auto-folder programs and/or accessories can
accumulate to about 1-1.5MB (e.g. NVDI, serial port enhancers, tcp/ip,
a file selector, ST-guide, etc.) Adding to this the Mint kernel (and 1.16.*
is -significantly- larger than previous versions), an AES and a desktop,
you can end up with about 500-700KB free RAM on a 4MB machine. Definitely
not very useful.

Hello,
I have been trying to e-mail him for over a month then about 2 or 3
weeks ago his e-mails that I sent him would bounce back to me within a
minute of sending them. I have not heard back from him since. I am
sure that he is just on vacation but I have not heard so cannot verify
this at all. Let us keep our fingers crossed.

Thanks,
Carey

3785. Re: STe on the way - ethernet?

Newsgroup: comp.sys.atari.st

Source record: 18179

Do not forget CrippleMiNT, from the same source as EasyMiNT, which fits, it says, on a single floppy, and will run on a ST. I tried the later kernels, and my STe did not like them, but I have not tried CrippleMiNT, and probably will not until all the TTs I have accumulated fail at once.

The STe was the machine I took with me on contract jobs away from home, and found it and STiNG would do everything I wanted. Almost everything, at least. There were some large JPG files that would not unpack.

Yes, the Secure Socket Link programs do need a 68020, but most of the other ones do not. And, Tera Desk is a good, and small, desktop for small machines.

So, I think it is possible to do a working MiNT setup, with TOS4.1 and Tera Desk, and have some room left in memory.

Have not heard a user report on CrippleMiNT. You might try it, and tell us all how it works.

Thank you for the definition, and source. Does not change my wild guess
any, though. Many programs other than monitor programs have been called
daemons, and as a practical matter, most of the programs involved in
e-mail and newsgroups do run without telling you what they are doing,
although they are not monitors or TSR programs.

Never would have guessed that it originally referred to a monitor program.

Thanks again,

Jim

Well, I've not figured that out yet, if I had the real money needed,
I'd replace the motherboard and have my 3rd Atari back into operation,
but the prices I've seen are outside my range. Plus right now the
parts are around my living room, motherboard died when the power
supply gave out when a ide drive was put into it.

> the driver.

IIRC all it is is an Auto folder prog and an ACC so that you can calibrate the active area of the tablet and specify what key(s) you want to simulate with the switch on the side of the stylus.

I've just run the Auto folder prog and it announces in English that it is a Crazy Bits CBTS driver. The only ACC that seems to fit the bill is called Tabby, and I think that this tablet was packaged with this software way back...

My Mega 4 has a 6 chip set. TOS 1.4 (Rainbow).
If you're going to the trouble to upgrade it, why not patch in the extra ROM space and drop in 2.5? The Wizztronics Compatablility Plus board is nice and works like this.

Desolder the CPU, or save yourself a bunch of time and just take a pair of small diagonal snips and cut out the old CPU.
Remove the pins and solder.
Place in the Compatability board (new CPU and TOS chips included and on board).
Solder it in.
Pull out the old chips and run one wire from the new board, or run 4 wires with a switch and can swap between the old and new TOS.

Took me about an hour to pop it in but it's a real neat/clean/easy install.

Other than the new, much better DeskTop...the goodies that a jump to TOS 2 offers are big ones.
1. Alot of bugs gone.
2. Can handle larger hard disks and partitions.
3. It'll pause and count down so your hard drive can spin up.
4. Others I can't think of right now...

Brian

Sam,

I've done the bus overclock (installation with solders) twice now, and I can also test overclocking your CPU to certain levels to see what it can handle and stuff like that. If you have any sort of installation problems and things don't work, don't be afraid to stop what you're doing, pack things up and send it to me (2 states away), or otherwise just ask advice. I know at least a few things to look for. So far I've been able to resolve really strange problems via Rodolphe's knowledge and my really expensive soldering iron ;-) I can also (perhaps later on) update the firmware of your CT60 should it need done. I've sent my JTAG cable to a couple people around the US for that purpose. Course in my case though I am getting scsi corruption and my DSP likes to be flaky sometimes but this seems to be the norm. I hear lots of reports of random unsolved problems. In my case, most definitely a decent ST-ram board would probably resolve the issues. The Atari 4mb board isn't great.
I even had a fit of craziness and had the courage to solder a socket into my CT60 itself so that I can overclock the bus to 25MHz ;)

Thanks,
Mark

you will have to alter the ROM jumper links, these are normally small solder pads near the ROM chips, you will need to alter them, ive never had a Mega ST, but thats how its done on the ST.

Well, I know of at least three of us, just in Tucson, AZ. However, one
doesn't read newsgroups at all that I'm aware of, and the other seems
to only show up here from time to time. I also know there are some
user groups here and there across the country. You might search around
for them, if you really want to get in contact with more US/North
American Atari users.

On non atari's I use Mozilla, but to be honest for many sites, HighWire is
becoming my browser of choice. I am in involved with the project,
but honestly it's gotten to where I just plain prefer it for some sites that
are problematic under Mozilla and IE. Then also under Emulation on the
same machines, HighWires performance is on par with Mozilla, sometimes
slower sometimes faster. Both have formatting problems from time to time.
Some things Mozilla will display that HighWire doesn't like and
interestingly
enough there are actually some images that Mozilla doesn't like, but that
HighWire will display.

Is there stuff that Highwire doesn't do yet? Sure and that's why I don't
only surf
the web with it yet. But alot of the so called modern web technology that
has
arrived in the last few years is misused at best and a waste of bandwidth if
nothing
else. A website I regularly read, actually had a very large front page
article recently
on how to disable alot of things like flash and quicktime or at least how to
replace
them with less bloated faster replacements. They took a somewhat dim view
on how they have been utilitized on the average webpage.

And dr who was right about the viruses. Linux has it's share, they just
aren't as
numerous as windows yet. Don't get fooled into thinking you don't need to
worry about them though. We get Linux viri notifications in our coroporate
email on a somewhat regular basis.

It's also not a question of Nostalgia with me. Its a sense of style, an enjoyment
factor in using GEM. Find out why someone loves to drive a 60's Jaguar and you
will have the same reason. Not the newest. Not the fastest, but damn I love
to drive it.

Sounds great !!

However I would not be confident enough to pull off this type of
upgrade :(I wonder if Alex Yu could do it.
I see one of those boards on Ebay right now.

I'm not famaliar with this board. Ask this guy about the ROMS before you buy it tho'! Looks like he might be selling the 2.06 ROMS seperately?

I'm not sure how this one will be installed...
Some TOS boards go piggy back on the CPU. Some run wires to the signals they need on the CPU. Some plug onto the Expansion slot. ICD supposedly even made a board once that had the TOS upgrade and a hard disk controller on the same board.

The nice thing about the Wizztronics board is you don't have wires running everywhere. You don't have to mess with trying to solder chips piggy back. Just snip out the old CPU and it sits right in. If you install it without a switch back to old TOS, it only takes one wire. If you put in the switch, its only 4 wires involved. If your Mega was one shipped from the Factory with a bad CPU...you'll see a little board and chip soldered to the side of the CPU. Depending on wether the TOS board you get uses the old CPU or has a new one with it....you might have to remove this patch and fix one 'factory cut trace' on the bottom side of the board (takes a piece of wire and two solder points).

Of course another, even better option is a PAK030! This would give you something more like TT TOS 3.something with the 32bit burst mode fast RAM, loads of CACHES and it runs at something like 32mhz?

As for soldering on the Mega...
It's a great machine to learn on :)
The traces are large, easy to see, and hard to ruin!

I.E. You're installing something that needs a trace cut. Oops! I cut the wrong one! Well, the good news is, they're nice large traces that are easy to track down and wire in jumpers.

BTW, I doubt any TOS board asks you to cut any Traces. Depending on the REV of your motherboard, and the type ROM board you install, you might have to patch some 'factory cut' traces back together....easy enough with a bit of wire and two beads of solder :)

The Mega is pretty dern hard to damage beyond repair, and the stuff inside isn't so hard to find/replace if you do have an 'oops!' accident. They don't etch boards like this anymore! Massive traces that are among the deepest etched I've ever come across before.

Two bits of advice that'll save you a LOT of headache and self doubt.
1. Get a good solder station with extra tips. A bad soldering iorn will have you thinking you can't...when it's actually not that hard!
2. Acid core solder is a bit easier to deal wtih (lower melting temp) but the solid kind is fine if you remember to have flux to go with it! Solid solder can have a pretty high melting point and be difficult to work with. The Mega mb and components are nice and large, so the ultra fine coreless solders shouldn't be necissary. Solder and flux aren't that expensive, so get a couple different kinds and sizes and experiment before you go to work.
3. Keep a wet sponge on hand...clean your tip often.
4. Go ahead and grab a package of desolering ribbon and the cheapest vacume pump or bulb you can find. Unless you're planning to take out lots of chips and things this should be all you need for desoldering tasks.
5. You can never have enough hands! Be creative and don't be afraid to use things like clips or tape to hold your stuff in place while you lay a bead to cool. The extra step to secure things somehow before you apply the heat really can save you alot of time and frustration.
6. Set up in a place with good light that doesn't blind you.
7. If you have some piece of junk that doesn't work anymore...use it to practice a bit. Try soldering wire to wire, pins to boards, wire to pins, etc...so you can get an idea of what works best before you get in cramped quarters.

It's really not all that difficult...and you just might get addicted to modifying your ST :)
There's a lot of neat things one can do with the right information. I.E. patch the serial port to 32k-baud. CPU upclocking. Upgrading to HD floppy drive. Etc...

Brian

Found the problem...
Had also installed a new CPU which was not defective, like that Atari had
'patched' in.
Repaired one trace that was cut at the Factory and all is well now.

Thanks,
Brian

3815. Way to create ST disks from Mac OS?

Newsgroup: comp.sys.atari.st
Date: 2004-06-17 10:59:06 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <2jdbrsF10256oU1@uni-berlin.de>
Source record: 18108

Hi.

Is there any way of getting an disk image as used by most ST emulators, and then turning it into a real ST disk? I'd prefer this to work from a System 7-based Mac, since the only floppy disk drive I have these days (other than the ST itself of course) is on an old Mac SE/30.

Failing that, are there any PC or ST-based tools to do it? PC-based I could manage at a push by using someone else's machine, ST I could manage if I go the route of hookng up to an ethernet adaptor. Could also try a USB-based floppy I suppose, but I believe some have trouble with DD disks for some reason.

Cheers,
Ian

Does somebody know what the message "68000 exception"
followed with "Error #-69" means? Has that something to do with
RAM (My TT has 64 MB RAM). It happens working with Tempus
and Calamus....

It's quite annoying especially close to a deadline.

I hope that someone can help me out.

Raoul Teulings

It is similar, but not exactly so on a MegaST: in order to to switch from
2-chip ROMs to 6-chip ones, beside the two easily identifiable jumpers,
one link to be set must in fact be a piece of wire about 2cm long, and also
a trace must be cut on the motherboard.

Yeah, also used different serial CPX to from HSmodem and it made no
difference. I will get it out again at some point and try again.

Coda.

I thought I had small-enough diagonal snips, but that caused some damage.
Bought a Dremel tool, with cutoff wheels, and cut pins with that
to change chips, and have not had to repair a trace since then.

Nope. Sorry. My compendium, last version, page B4, memory map,
says that 0x69 is in the range of 68x00 Exception Vectors that is
reserved by Motorala, probably for test purposes. So, there is no
programming associated with that vector.

As a very wild guess, I would try changing the MMU chip, which is
an expensive thing to try.

Is your TT fan working?

TT, with 128 MB RAM. Have Calamus 2000, do not have Tempus (what is it?)
and have never met that one.

BTW, you certainly have a good selection of good hardware!

I'm not sure, but I've seen it before. In my case I believe it was a hardware problem.
With a Falcon CT2b. It got worse and worse as the machine warmed up.

I believe that I either had a bad connection or the machine was overheating. I replaced the CPU fan, installed an additional fan to the chasis to suck hot air out, and while I was in there reseated everything not 'soldered' in, and spot checked all the install points of the CT2b with a touch of a hot soldering iron (seals any cracks that might have developed over time).

First thing I would check if I were you....
Give the machine a good cleaning....this includes reseating anything inside that's not soldered down (chips in sockets, SIMMS, expansion boards, pluggable cables, etc). Over time chips might not fit as tightly, or just develop enough dust and corrosion on chips and such to make a difference.

In a sense the message is self-explanatory. -69 is the number that
Magic reports when the program has taken any 68000 hardware exception
and Magic has trapped it - the type of event that would cause bombs
under TOS. As Magic does not report the actual exception number, further
digging is needed to find out what is going wrong. Basically it means
that your progran has crashed in a way that Magic can handle.

It displays with one line only showing, which says:

"Attachment: article (UUE)"

Newsie does not attempt to auto depack, but if asked to "extract
binaries" appears to do so, but of course, nothing appears on the disk.

The correct text is available, and can be viewed by looking at the
article in the text editor.

BTW, I found the problem because mint gave an error message, telling me
which line in the file was faulty. It doesn't do this every time, which
puzzles me.

>Unfortunately the source code release was not v0.961 and I have somewhat

>spend the time on the old source listing. Unless the newsie users don't
>care about v.961?

I looked around on my HD the other day to see if I could fine any
information on .961, but without success. I really can't remember why it
was released, but would be reluctant to return to .960 in case .961
included an important bug fix. However, I'm one of those who would like
to see Newsie updated, and I hope you can persuade John Rojewski to
release .961. I'm sure he will, maybe he has just forgotten he did it !

Cheers

Hi, Chris!

CW> Absolutely. Realistically the CT60 and Hades and so forth are only for
CW> those who are dedicated or mad enough :-) to want to spend that kind of
CW> money.

It depends on what you use computers for. To me all that multimedia stuff
is moreless uninteresting. OK, it's nice to watch a bonus video track on
some audio CDs, but mp3 does not really matter - I prefer the good sound
of audio CDs in my stereo.

Therefore I use my Ataris in the classic home computing domains - no need
for more speed... handling is the most important point to me.

Regards,

Alexander

> because they are very cool, i used an st for music up until only a few years
> ago, desire for large scale hard-disk recording forced me to windows,
> without regrets either to be honest

I'm probabaly one of the few people who don't use my Atari for music,
and never have. It *IS* a bit of a nostalgia kick for me, I've had
Atari's ever since I was a kid, I first learned to program with an
800XL.

However it does have it's advantages, the software is cheaper for one
thing, and the system, is more stable and reliable, and having the O/S
burned on ROM chips has always made more sence to me, you can always
get a clean boot. The software is small, fast and efficient. The Atari
- realistically - no matter how many accelerators you bolt onto every
part of the system isn't ever going to be able to compete head to head
with a modern PC in terms of raw processor power and graphic system
grunt (not that people dont try regardless!), but the software for the
Atari is built within the limits of the system, so unless you are
doing something that demands sheer power, you dont really notice it.
My Atari is an 8Mhz STe and has a Megafile 30 and 4mb RAM, my PC is
1Ghz with a 40Gb hard drive and 256mb RAM, but my Atari boots quicker,
and can run Superbase Pro and TimeWorks faster than my PC can run
Office 2000, and it doesn't freeze up every hour on the hour.

I wouldn't fancy living wihtout a PC at all (I'm far to lost to
technological addiction for that), but I wouldn't want one as my main
system.

>
> so how is the atari scene these days? how is the hades, the milan etc

Sadly, not being built. I want a Hades, actually perhaps a TT would
be more fun.... And WTF happened to the ColdFire?! All I need is a
lottery win.

That's Tempus WORD. There used to be a fantastic Tempus editor (for programming), too, which seems to be discontinued. Much faster on an ST than anything else I know.

I have...thats why I doubt your statement! MP3 quality on my Falcon
is not nice, despite the presence of a PowerUp2 accelerator...

> Even a stock falcon is capable of playing MP3 files with perfect quality

> its age.

Absolutely. Realistically the CT60 and Hades and so forth are only for
those who are dedicated or mad enough :-) to want to spend that kind of
money. Massively more grunty systems can be had for much less money if
people are prepared to forgo Atari compatibility. I only keep my Falcon
and run ARAnyM because they have a cool factor...linux I find also has
that factor with the added bonus of being able to use the performance
of systems that cost significantly less money...I can get an Athlon64
system here in New Zealand for significantly less than a CT60 will cost
me. Which is faster? If you try to talk CT60 you need to smoke less of
that stuff! :-)

To keep the peace I might try creating a GEM-alike Window decoration for
KDE 3.2 if that will keep you guys happy! I'd find it interesting! :-)

Highwire is getting there. Better compliance, scripting, java, and a few
other issues aside its getting there...

Those issues are important however, as much development for the net is
reliant on those issues, so I'd still have to lean the 'other side' for
the sake of compatibility with those 'relevant' standards...

3845. Plugging Troll B3

Newsgroup: comp.sys.atari.st
Date: 2004-06-19 05:10:22 UTC
From: FireflyST <geek@atarians.com>
Message-ID: <2VPAc.17640$Y3.16955@newsread2.news.atl.earthlink.net>
Source record: 18140

Hey there Atarians,

I'm just plugging the latest version of Troll here, and I have to say,
it's the most stable and easy to use news client for Atari yet!

Way to go Rajah!

- FireflyST

"In the beginning, the universe was created. This made many
people very angry, and was widely considered a very bad
move." - Douglas Adams, The Hitchhiker's Guide to the Galaxy

Glad you asked Steve :-)

Any Atari (or clone or...) computer owners who can get to Cheshunt,
Hertfordshire, England are welcome to come along to our monthly meetings
where you'll get friendly support. Combined with a chance to meet 2/3rds of
DDP Translations and Steve himself that's a gig that can't be missed!

Next meeting is this coming Wednesday the 23rd June - we're only a couple of
miles from J25 of the M25 - map and so on on my web site:

Hi all,

I've dug out my Veloce STe, though I think there was supposed to be some software to actually turn the thing on ? I have 2 swtiches on my STe, have no idea what they are its been that long, in anycase does anyone know how to get it all working ?

thanks
chris

I have and care about v.961, but my beef is with the non-dynamic expansion
of the address field, which means I cannot email my higher authorities who
use a very long address. Newsie just drops the extra letters, causing a
refusal of delivery. I would be very grateful if you solve this.

Would sending you the v.961 zip be helpful?

Thank you,
Charles.

Hi All,

Do I have to use an ATX case, or can I get away with using an AT case to
re-case my Falcon. I already have an ATX psu for the CT60.

Thanks everybody!!!!!!!!!

No real difference between AT and ATX cases besides PSU, port plane and
possibly the motherboard screw pattern. Since you already have an ATX
power supply which will probably screw on to the holes for the AT psu, and
the screw pattern doesn't matter for the motherboard since you'll have to
make new mounts, and since the ATX port backplane is meaningless to your
falcon motherboard, I don't think it would be a lost cause to attempt
using an AT case with your purchased ATX PSU.

Thanks,
Mark

I have also downloaded Troll,both versions,but neither seem to
have a Doc file with them on how to use Troll or set it up.

Loading the Prg from the Desktop just makes loading noises and
throws me back to the Desktop.

Any ideas??

A visit to the Home page only throws up Javascript.

Regards

Derek

Anyone ever use 800XL Deejay with a Falcon? I think it may require using the lan port? The serial port is not working. The DOC is in German, so I haven't been able to figure it out.

Thanks!

Bonjour Derek

> I have also downloaded Troll,both versions,but neither seem to
> have a Doc file with them on how to use Troll or set it up.

The doc file is an hypertext *.HYP file. You can read it with STGuide or HYPview. The guide is only in French for the moment. No time to translate: prefer to go forward in the code. Dennis proposed to translate it in English, but he very busy at this time. So patience. Use your brain and your eyes.

> Loading the Prg from the Desktop just makes loading noises and
> throws me back to the Desktop.

How much RAM do you have ? What OS (TOS, MiNT, MagiC) do you use ? What machine do use ? It may help if you tell the context.

> A visit to the Home page only throws up Javascript.

Then go to the direct link i always counsel. Or disable Javascript or change your browser (HighWire is very good). As nobody send money for Troll or others of my programs, I must use a free webpage account, and therefore with ads/javascript.

Regards

Pierre

Bonjour FireflyST :)

> I'm just plugging the latest version of Troll here, and I have to say,
> it's the most stable and easy to use news client for Atari yet!

Many thanks :)

Well, not so stable. I still have a crash sometimes when headlines are
downloaded in the new subscribed newsgroup. Then still bugbusting and
working for the B4 release in July/August ;)

Regards

Pierre

3864. Archiving Atari stuff

Newsgroup: comp.sys.atari.st
Date: 2004-06-21 11:05:56 UTC
From: kryten_droid <kryten_droid@ntlworld.com>
Message-ID: <0aABc.56$Mj3.8@newsfe2-win>
Source record: 18060

Hi all.

My mate has a lot of Atari stuff that he is planning to ditch because it takes up a lot of room and he hasn't used most of it for a over a decade. I expect many in this newsgroup have similar collections.

This includes an 800XL, an ST, a 30MB SCSI hard drive, and many floppy disks.

I'd like to transfer the files to one or two CD ROMs, and perhaps replace the huge hard drive with a tiny modern IDE drive (2.5" or CF microdrive?).

I found my PC can't read most Atari disks of course.
No doubt some of them are copy-protected (laser destroyed sectors?) and will need the duff-sector information preserving.
He paid for them so I reckon he is entitled to put the data on a different storage medium.

Writing a PC program to read them looks laborious but would read disks pretty fast.
The alternative is writing utilities to transfer files over the serial port: slow but surer to read the data using the Atari disk drive.
I had a look at the ST parallel port for faster laplink style transfers, but it does not have enough handshaking signals.

Anyone got any helpful suggestions?

> The doc file is an hypertext *.HYP file. You can read it with STGuide or
> HYPview. The guide is only in French for the moment. No time to translate:

I found enough information in English in the archive to set it up - so there's no rush for any English hypertext yet IMHO.

> Anyone got any helpful suggestions?

I recommend disk imaging utilities on the ST end.
Make an image for each disk with the ST then either burn the CD from the ST or move it to some other machine for the burn. Options to get it from one to the other....

If his ST has a host that hooks up to a true SCSI drive, and your PC has a SCSI host.......you could use GEM Explorer on a PC to grab the images from the ST hard drive. With HDDriver you could use a DOS or BGM/DOS partitioned hard disk to move things across. I.E. I use an old ZIP drive for this purpose, using a special format that looks like DOS to a PC and BGM to an Atari.

Ethernet is also an option.

Serial ports with a null modem cable and your favorite terminal protocal matched at each end (such as Zmodem) also work. The ST isn't likely to lock with anything over 19200 baud, but it will get the job done.

You might also consider a Catweasel floppy controller for your PC. It was really designed for those 800k Amiga disks, but the controller comes in handy for lots of formats that your typical PC floppy controller just can not handle. I'm not sure what software comes with it...never owned one....but it might be worth a web search to find out. If there is 'tracker' copying software with it, it just might be ideal.

Brian

True, but do you also have a PC or Mac or Linux system?

I remember I did a search once with Hotbot or Google, and found them in
some classic FTP sites, like UMICH.EDU or FUNET.FI. Can't remember now.

Do a search, it will show up

Hi all,

I have a question to the Eiffel keyboard/mouse interface:

Can I use own keyboard layouts only under MagiC?

Ciao, Bernd

hi!

Of course not:)

The first point, eiffel card is really plug and play!
Just plug and normally, keyboard and mouse run:)
Virtually any ps2, serial& ps/2 adaptator and usb&ps/2 too:)

There is compatibility with magicC, MiNT and single tos:)
ONLY THE LAYOUT OF KEYBOARD CHANGE, azerty, querty....

The last patch from didier Mequignon extend the possibility
to multimedia keyboard too!

bye!

The limits look hardcoded ("struct mbox".author_email[50]) truncated further
by simplify_author() to 40. No idea if upping those limits alters the
mailbox file format 'cos I haven't looked (no realistic compiler atm) but
if it does a fix will take time. Naturally, if one increases a hard limit
it has to be worked back to ensure other things don't need increasing.

I was unable to make any progress with aranym this weekend. Dratted windows
box got itself an unlisted virus. Took time to knobble that.

Hi,

How and where can I obtain an Eiffel?

Thanks,

Sam F.
Virginia U.S.A.
Atari Computer Nut
C-Lab Falcon, 14mbram,540mb hdd.,

3878. Re: FA: TT030 keyboard final hours

According to ebay, the final bid is in.

What's up?

Thanks,
Sam F.
Virginia U.S.A.
Atari Computer Nut
C-Lab Falcon, 14mbram,540mb hdd.,

Hm, I have here some trouble with wrong keys.
I use an german AT keyboard.
ALT GR doesn't work like the real ALT GR key. When I press the '#' key
(left from Return key) then I become the tilde, the '^' (under ESC key)
works like the F8 key and so on.

And how can I use the 'picture up' and 'picture down' keys following

Picture up = Shift + Curser up
Picture down = Shift + Curser down

How can I change this?

A second question: How can I get the third key allocation on the PC
keyboard? With my older keyboard interface I can use the ALT GR key.

A third question: What is "Keyboard SET" in the Update/Extra Dialog?
And what is "Init Keyboard Table Set 3"?

Ciao, Bernd

Hi there,

Alexander Beuscher wrote:
> Hi, Chris!
>
> CW> True, but do you also have a PC or Mac or Linux system?
>
> Yes, at university. Linux system. For simulation, synthesis and such.

Such tasks would not be easy to accomplish using a Falcon...
I happily accept that my Falcon is as much use as bottled
fart gas, but I still keep it because of its nostalgic value! :-)

I use POV-ray a lot. I started using it on the 520STe, but today
my traces run from pov scene files that comprise tens of thousands
of objects, photons, seriously major use of atmospheric media, and
radiosity. An average 1600x1200 trace might take hours on my Linux
beast, but if I relate back to the speed of my Falcon I'd be waiting
for months to finish some of those same traces at lower resolution!

Its just not practical to get anything serious done on the old 030
now...

For the Atari 8 bit disks, a PC running APE (http://www.atarimax.com)
and the ape and pro cables would work for most disks. Copy protected
ones may be a little more difficult, however, checking the internet
for these disks already in .ATR or .PRO disk image format is advised.
After you get them on the PC, just burn them.

For the ST side, disk utilities such as MSA archiver or ZIPping non
protected disks will get them ready for moving to a PC. I've used the
PARCP (http://joy.sophics.cz/parcp/) parallel port cable method and it
works great. I've used it from transferring from my falcon to the PC.
Then just burn them on the PC.

Both APE and PARCP are excellent shareware programs. You could also
put together an Ethernec (http://hardware.atari.org/ether/index.htm)
adapter for the ST.

Either case, you will run into disks that may not be able to copy.
Hopefully you will be able to find disk images on the internet, or
just keep the disk and reduce the amount of disks you keep. After you
burn them, donate them to a local Atari Users Group or sell them
online.

If you need help, let me know.

3886. Atari STe with no sound

Newsgroup: comp.sys.atari.st
Date: 2004-06-22 22:05:53 UTC
From: Skyblasc <sagaroina@terra.es>
Message-ID: <anahd0h6r46vv7601ov4coo3pq37ccammi@4ax.com>
Source record: 18081

Hello everyone,

I've recently adquired an ATARI STe, bundled with a B/W Hi-Res
monitor.

The computer boots OK and diskdrive is fully functional. Monitor also
works fine.

BUT... I downloaded Cubase-Lite for testing the sound capabilities of
the STe and loaded the demo song pakced with Cubase-Lite, and the
piece was going on but with no sound.

I tried turning up the volume in the monitor, and also tried the RCA
sound outputs at the back of the STe but then again, no sound.

Is there any way to test if sound chips are OK? I'm thinking of some
kind of test-software or something, just to discard broken music chip.

Thanks a lot!

Skyblasc

You need to connect midi equipment as the internal sound chip is not used by
the likes of Cubase, it is very basic and unlike a PC sound card

You could check the general ACC /CPX to make sure that the sound is not just
muted.

Do you get a beep when you press a keyboard key?

CuBase Lite is a MIDI sequencer....it does not make sounds unless you hook a MIDI tone generator to the MIDI ports.

To make music using the ST sound chip, or with 8bit samples internally (or both) you'd do better with a tracker that builds MOD files, or something similar. Right this moment, my brain can only think of a package called Quartet that does this. There was something by Activision called STudio I believe which also works nicely on an ST. Many others are out there! When my mind isn't so foggy I'll come back and offer some links for the topic. Meanwhile, you can test your ST sound with some free demos or games. I doubt the sound is broken :)

Brian

I read this too, but I can't use the ALT GR key like a real ALT GR key
so that I can reach the third key allocation on a PC keyboard.

> F11 HELP key HELP as default, can be programmed
> F12 UNDO key UNDO as default, can be programmed

I know this too, but how can I programming this keys *free* with own key
allocation? This is my problem.

In the Eiffel configuration program I can use the key alternative only
who are in the popup field.

Ciao, Bernd

Thanks for your answers to all of you.

I'm more used to AY music chips from 8bits computers, so I though that if Cubase is the great software everyone says it is, it would be my first choice to test sound on my new STe. And of course I was thinking it used the internal STe sound chips :)

>ST sound with some free demos or games. I doubt the sound is broken :)

I hope so!! ^_^ I'll try with a demo

Thanks again.

Hi, Chris!

CW> Its just not practical to get anything serious done on the old 030
CW> now...

Sorry, but are word processing, spreadsheet, programming and such no serious tasks? To me it's not nostalgic but practical to do this on my Atari. I don't use raytracers and don't simulate/synthesise for private projects, so my Atari does not need to be that powerful. That's what I wanted to say.

Regards,

Alexander

Cool! I would be interested to buy one for my Mega4! Will we be able to
use larger IDE drives? Like 2GB, 4GB or 10GB +? What type is SIMM? 72pin
I imagine. What max RAM limit for TT Ram?

This is really cool indeed.

Tim

Definition of "serious" work is wide. In productuion of ETA sailplanes, which are one of best sailplanes (prolly most expensive as well) they use MegaST for wing stress tests. Mind u, its not 030, it is 68000 machine. And as u said, synthesis/raytrace is not only serious work. One can write doctor disertation etc on 100GB PC or plain amsradPCW, in any case it is prolly damn serious work...

Janez

In 69 they used 4 bit machines, 1mhz, no 3d gfx and yet, they send a man to the moon...

LOL

and the computers they use the mars rovers and in various other NASA
products are not much more powerful than Atari ST either...

There are two files called vorbis.slb.
One is in the 68060 folder and the other in the
ivorbis folder. What is the difference ?

Is it my imagination or is video image quality better
in this version ?

I use mine because I have them, and they still work.
I enjoy that software titles are very inexpensive now days. I could never afford them back when the platform was very active.

I also have quite a number of applications I began using as early as 1988. I've grown to know them well and it is second nature. The tools get the job done. Why start over if there is no need?

I use the machines also in classrooms and music labs. They are simple and good for teaching basics. The documentation of things like Page Stream and Photoline are SUPERB for teaching students about things like Desk Top Publishing, or a MIDI Studio. Here is an example and comparison.

Page Stream comes with an excellent manual that is as well thought out as the software. It teaches you terminology of the industry in such a way that will apply any future lay-out jobs you do...be they with computer software or with scissors, paper, and glue. You get some introduction to the history of printing...explinations of primary colors and how they work with paper vs a computer monitor. It even explains some of the differing standards that range from industry to industry and nation to nation. It explains different kinds of printers and what is best for the kinds of jobs you might do. It delves into the human perception of printed text and photographs, so that you better understand resolutions and when it is more appropriate to go with high resoultions or lower ones to give the human eye the best impression. It talks about techniques one might use to draw attention to the important aspects of your document and make things STICK in the reader's memory. All this! And it's a small book written on a very good level that almost anyone can understand.

A similar product for Windows tells you nothing. It usually doesn't come with a manual at all. Instead, you use wizards and answer dumbed down questions...then end up with a product that an image setter has to redo anyway. Most people using this software end up with a disk full of crap, and documents that are little more than distracting CLUTTER to the eye and mind. They waste $50 a pop on ink carts, glossy paper, bad clip-art collections, and things like this when it's really not necissary. And the list goes on.....

In the MIDI studio...ST machines are fine teaching tools. They are very hands on, and really help a student understand how a MIDI engine works. I will very much agree that modern PC and Mac platforms can do far more these days, all in one box, for little cash in the long run....however...when it comes to teaching fundamentals....ST and Falcon class machines are very good tools. Much of the software is free these days.

Atari machines are also very good for teaching basic electronic skills. The old mother boards are of a generation that you can actually show students the traces, and talk about how address lines of a CPU or other networking circut

works. You can let them pull out parts and cut traces and repair things....upclock chips...EXPERIMENT on the true component level...simply because things are still large enough in that generation of components to do such. Why does it matter? Well, it makes it easier to understand and visualize what is going on with the near microsopic circuts of today's gadgets. That comprehension leads to better hardware and software today and tomorrow.

Sure...go ahead and throw alway all your history books....don't bother to put your hands on and learn about a simple kite before you design your first supersonic jet air craft! I wish you luck!

Brian

The diffï¿œrence:-0), you have 68060 processor or you aven't!
For the last version, there is optimisations for ct60:)
>

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Hardware, Games/ Software, Books and Accessories! Atari 2600/ 7800 Games, Classic Atari 8 Bit and Atari ST Computers Plus Atari Jaguar Games and Consoles! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!!!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

>man to the moon...

Yes, and the chance that such a mission fails is the same as if you
would use a very fast machine - maybe higher!

Cpu Power cannot control the beings in universe.

Also I want to say is that new PCï¿½s are shit. Because you cannot play
MS-DOS Games and new interesting Games are very rare today.
It seems that new PCï¿½s are just made for dumb 3d shooter where you can
trace or fight people like sadd.. or bin.
Otherwise if programmers would learn to program machines (assembler),
a 200MHz cpu with a 3d accelerator would be enough to play extensive
games. And the rest of the development ressources is turning back
where it came from - Uran, Coal, Metall Alloys and, and, and,
and......

Have a nice day!

Hi, I used to have an Atari, about 8-9 years ago, and it was my main computer (until the family picked up a PC, then I managed to get one too). I first bought a 520 STfm, but soon had the chance to pick up a modified STe, which was supposed to be 1040. I've just dug the Atari out of the attic, and it boots up (which is a good sign), but I'm curious to know what exactly I am using. Is there any way, barring examining the case, to tell what I have hardware wise?

Also, is there any sites regarding upgrades? I want to hopefully do up my dear ST, at least give it a facelift or such.

Also, has there been anyone who's put an ST into a case, ala mega ST? I've seen on ebay a spare keyboard part, and the mainboard + powerboard, and was wondering if I could convert it into a mini PC style.

Thanks, and sorry if the questions seem noobish

Chris

I've recently done the same thing - bought an STe from ebay. There's an app called WhichST, but I can't find it online anywhere. I'll have a look and see if I can find a link for you.

Cheers,
Ian

Speed is essential, esp when u need fast reactions and corrections of path etc, i agree. I just wanted to say u can do VERY serious things on lower specs machines as today ppl use to just display icons, im sure some70% of cpu power todays goon BIG OS and to important display and presentation features account, like 3d virtual desktop switcher; normal switch uses 1000times les cpu/3dfx and swith instantly instead of seconds in 3dfx.. This is just an example, same as for instance 3d Mac taskbar...

Someone mention 030 is used in M1 tanks.. My guess for fire control as well, id like to see guys claiming 030 is usellese to stand in front of M1 then ;))) I came from former socialistic country and i was train to operate handy anit aircraft missile. Dated 1967, it had a capability to guide missile's IR head to lock an object, but it also analised input from IR head, calculate angular speed to avoid firing on birds, clouds, sun reflections etc.. All that russian made and was placed in gun like holder whee i had a trigger.. let me say i find that totaly WRONG way of usage, but it prolly used lowerspecs as ST ;)

I am that some guy. And, I know that the kind of space missions under discussion are done with computers with rope memory. That is mag cores with loose wires running through them, arranged in patterns that form a binary program. There is nothing to go wrong with that sort of memory, and still it is doubly redundant.

Standing in front of an M1 is a foolish thing to do. They are sort of sharp in the front, and one guy got killed that way, at the now-gone Warren, Michigan, Tank Plant.

And yes, the 68030 is used in the fire control processor of the M1.

Chris Wilkinson <misterblobby@NOSPAMsnap.net.nz> wrote in message news:<1087879964.346391@kyle.snap.net.nz>...

> Its just not practical to get anything serious done on the old 030
> now...

I guess that depends on what you consider "serious". The only thing I ever really use my Mac for is Internet, specifically web browsing (at least until a more complete web browser is made for my Falcon), and printing my digital photos - and that's just because my Falcon lacks the USB port my camera and scanner require, and up-to-date printer drivers, both of which *could* change, assuming there's enough interest for someone to take on the projects. For everything else - all my "serious" work, I prefer to use my Falcon.

To be honest, most modern PC/Mac software (PC more than Mac) these days disgusts me. Especially the pure garbage Microsoft puts out. They many times rely heavily on "Wizards" or automated functions which make assumptions about what you want that almost always aren't true, and don't let you change it to what you do want very easily. When a problem happens, their manuals (if they exist in any practical form) give very little help, and you are refered to an FAQ or an animated idiot on the screen, both of which have no reference to your actual problem, only the basic troubleshooting issues that the most green computer-illiterate idiot would even find mildly helpful. While I've had more problems with PC's than I care to count, not once has an FAQ or animated idiot even come close to helping me solve the problem. In fact, most times, when I do finally get to talking to a real person about it, they follow a script (based on the FAQ that didn't help me), and absolute frustration ensues. Anyway, enough ranting...

Atari software on the other hand, almost always lets you get your hands directly on the controls of your project, letting you handle every function yourself rather than the program assuming you are stupid and cannot possibly do anything without its automatic help. The Atari manuals (whether paper or electronic) often tend to give almost too much of the gory details of the software's functions, and in-depth problem solving. No FAQ's, just nitty-gritty details about the actual operation of the thing, along with the basics (unix ports usually excluded). So it can be used not just by the green beginner user, but also the more advanced ones, and are actually productive in helping new users learn advanced ideas. If there are major issues, there's this newsgroup to rely on, which has been immensely helpful to me in a "crisis". And to top it all off, Atari's are actually enjoyable to use. I've never been able to say that about a PC or Mac (especially

about a PC).

So that's why I still use an Atari, and that's why I know for a fact that Atari's *can be* and *are* useful for serious work, depending on what you use them for.

As it is a freeware player now, I suppose Didier is free to reimplement
and market mp3 support again. The fees only apply to non-freeware stuff.

ON Scanning....
I've personally never had any problems with it. It's not something I do often. I have Nova drivers and a Paragon flatbed. It scans straight to the hard-disk. The trick is this. If my scan is never going to paper, and is intended to be viewed on your typical VGA monitor, then why scan any higher than 72dpi? You're just throwing away memory if you do, because the screen will never show anything tighter. If you're going to paper with it....people still very often go way overboard with scanning resolutions! For those who really do need to work with massive images in super resolutions with billions of colors, then use a sofrtware suite with virtual memory (just like 'modern' PCs do). Many of the pro line softwares can indeed work d2d with images and sound files. There are also utlities like outside.

Funny...My Windows XP PC has 256mb memory or something like that. I rarely do anything with huge data files, or run more than 3 or 4 apps at once...yet, it hits this 'virtual' memory constantly.

True enough about GEMDOS printer drivers...but BETTER and older printers can still be found.
Keep in mind, your best quality glossy Magazines on the market are still done as low as 180dpi.
Your news paper, 32 to 72 dpi or so.

Today's 1200dpi printers are pretty much a rip off. You can get them for 30 dollars, while replacement carts cost as much as 60 dollars! They eat up these cartidges, and computer memory, and expensive papers like a kid with candy. In most cases however....your average home PC user can print out a photo with a good 600dpi printer from the 90s on a medium quality paper...print the same photo with a 1200dpi printer of today on the same quality paper...and often, that of the older printer will be BETTER to the eye. The quality of the paper alone has a LOT to do with it!

When you get into things needing super resolutions....well...for the cost and troubles involved, I myself would rather work with FILM! Better resolutions and colors. I would not use my Atari for this...altho it might be possible, as you say, memory would run out fast for printing slides and such. How many people really want or need to make film slides on a computer? A few in hollywood maybe...but they aren't running generic PC equipment at all! They have specalized tools from graphics labs with their own lables on it (I.E. Grass Valley, Pennacle, etc). Sometimes you'll see an old Falcon, Mac, PC, or Amiga dedicated to one or two simple tasks in such a lab...with a different brand

lable on the cover ;) When such labs choose a piece of kit...it's usually more about saving time than anything else. "Hey...this machine can do this easy, the software exists already, etc....let's just buy it and the rights to put our lable on it, patch it into our system....blah blah."

Brian

Oh, I forgot to add....
Older graphics software...on ALL platforms are a lot smarter when it comes to memory management.
Where the typical PC will automatically load the entire image in its full resolution into memory all in one go...
You'll find that older applications will nibble out just the bits it needs to display to your screen or window. So, if you're working with a Falcon in 640X480TC, in full screen mode....then that is the highest resolution that the software will take up memory for. As you ZOOM IN...it picks up more pixils from the disk, and throws away whatever you're not trying to 'see' at the moment...and so on. In then end, you get the same result. Actual edits are usually done to a temporary copy of your image, in memory if there is room, on disk if not. When you actually do a digital filter of some kind, or manipulate the image, it gets the bits of the image it needs in a hurry before 'saving' your new information, does the calucations and such, and well, you the user never really know the difference. When you go to 'print', it loads up a 'band' as large as the memory you have avilable for printing...dumps it to the printer, then has another go at it till it's all done. It's no big deal really...modern PC machines still do this...in fact, Intel architecture is the worlds worst in that to this day it doesn't like (or can't without some pretty special additional hardware and software) to touch anything in memory or disk without loading it into 256k chunks of memory and moving it around....hence the BIG deal made about 256k L2 caches built into the chips...that do greatly speed things up.

Really well done Pro suites, even today, still do things this way. The cheap crap, for ANY PLATFORM, will of course gobble up all your memory quickly and cry for more.

Brian

I've heard rumors that Russian AirCraft makers ruled out using solid state components in at least half of the fleet. Why? Because the older tube technology, while larger, heavier, and more energy-hungry, would NOT be upset by radiation in the event of nuclear attacks. Hence, while the rest of the world's 'superior' solid state technology is grounded and useless in the aftermath of nuclear combat...Russia's surviors could wait out the worst of the fall out, and be hopping about the globe establishing order and dominion again in short order.

Truth be told...other nations likely thought of this as well...and feel it a good idea not to simply throw everything away or put ALL faith in technoloical trends. There are pros and cons in any decision.

I'm not buying that one! I have XP Pro with 256Mb ram. I have it tweaked where all the unnecessary services are shut down or removed. All the pretty graphics animation crap is shut off and eye candy turned down. Still looks like it did before but very fast.

I can fire up Vega Video or TMPGEnc and encode a 21Gb uncompressed AVI I captured of a home movie and encode it to a 4Gb DVD MPG file. I can browse the web, check my mail and do other things easily.

I only have 256Mb of ram and I know XP likes 512 for best performance, but after tweaking XP just right, I no longer need more then 256.

LS

PS Don;t get me wrong, I'd die for a modern Atari machine...so I stick with Aranym for now.

Yes, but even if your Falcon had USB, what would you do with the
huge files that scanning can generate? Printing is vital to many
people today too...the basic inkjet printer drivers that can be
had with NVDI are not much use with todays 2880dpi printers...

> drivers, both of which *could* change, assuming there's enough
> interest for someone to take on the projects. For everything else -
> all my "serious" work, I prefer to use my Falcon.

Linux is my choice for getting stuff done...all the software ever
needed comes on the distro disks, and anything more can be quite
easily downloaded...serious is in the eye of the beholder, but my
Falcon doesn't have enough RAM or grunt or storage to do the things
I now like to do...except audio especially MIDI...

That is just a rumour, a very innacurate one, stop for a minute and thk how
a Geiger Muller tube works then compare that to a thermionic valve, add a
few giga watts of EMP and its just as useless as silicon based systems.

Use Word+ to save them as .RTF files. The PC can then read them.

Hello again Joe,

I use 800XLDJ with my Hades and it works great. I use the Modem 1
port on my Hades. You should be able to do the same for the Falcon
and the STe. If you need any DI image files, email me. I have a
lot that I will soon be putting on CD. I am still in the process
of making more files for the program.

I would try Best Electronics or B&C Computers. They have almost
anything you would need.

If you are talking about First Word Plus, there was a PC version
made. I would try some PC sites to see if you can get ahold of a
copy. Or you could try running a ST emulator on your PC and maybe
save the data as ASCII.

They use Postscript, PCL and proprietary hacks as they always have.
That aspect of computing hasn't changed much really. For the "rest
of us", ghostscript has always been a suitable workaround.

It works fine on my STe, but I can't get it to work on my Falcon.
The program runs, but I can't get any transfers going. As far as I
can tell from translating the DOCs it looks like some hardware mods
are required to use the Falcon. I gave up and went back to the STe.

>I have...thats why I doubt your statement! MP3 quality on my Falcon
>is not nice, despite the presence of a PowerUp2 accelerator...

Well, it seems to me that your Falcon suffers from the SDMA bug. There are two ways to cure this: The first and more often installed patch (but also more difficult to get it running correctly) is the so-called "clock patch". Could you check out if there is a 74F04 or 74F08 on top of chip U63?

The second is to install a simple 68 Ohm resistor to the SDMA chip.

If you have neither patches installed then you are right: MP3 replay quality is poor on these Falcons.

I recommend every Falcon owner to immediately install the patch.

>of systems that cost significantly less money...I can get an Athlon64
>system here in New Zealand for significantly less than a CT60 will cost
>me.

It's not always the price that counts. My ATARIs are more user friendly and I am faster in using it. So for the average every day tasks my Falcon is still faster than those cheap PC systems of today.

I often just check emails. It takes less time to start my main Falcon (which has only an Afterburner board installed, the CT60 Falcon is my second Falcon), to get my Emails and then shut it down again than to even start the PC that stands just next to my Falcons.

I even use my Falcons for image manipulation. Although the PC is faster in spinning images, using filters etc. the user interface on most of my ATARI applications is more friendly and together with the DSP I am nearly as fast as with my PC so I still use the ATARI for that.

>Which is faster? If you try to talk CT60 you need to smoke less of
>that stuff! :-)

So, you cannot give an answer that this or that system is faster it depends on the task you perform.

>Use Word+ to save them as .RTF files. The PC can then read them.

First Word+ can't save as RTF - at least the Atari version can't -
only WordPlus DOC and ASCII. I presume Rich no longer has an Atari
or 1Word+ - if he has, then saving as ASCII will allow Word to
read them; or run an Atari emulator - provided he still has the WP
program disk.

If not, use an ASCII editor (?Notepad?), remove the header down to
and including the ruler, then multiple search and replace: Replace
ASCII 028, 029 and 030 with a space, and all Esc ? combinations
(where '?' is a wildcard) with nothing (these are style and
end-of-page commands etc). You will be left with pure text. You
could with a little more work retain any styles by converting the
Esc combinations to e-mail style attributes: Esc+129 (umlaut-u) =
Bold on (mark *), Esc+130 (e-accent acute) = Light on (mark ~),
Esc+132 (umlaut-a) = Italic (mark /), Esc+136 (e-circumflex) =
Underlined on (mark _), Esc+176 (a-tilde) = Superscript (mark say
+), Esc+160 (a-acute) = Subscript (mark say -). Esc+128 (C-tilde)
switches each style off again (place same marker as for switching
attribute on); it also marks formfeeds. Combinations are also
possible - there is a good discussion about this in the IdeaList
documentation.

Then in Word you can convert the e-mail style attributes back to
what they should be. Longwinded, but doable.

If you are using a mumble mumble PC, get the program Ultra Edit, which is shareware, and pay Ian Mead (?) his $30 USD for it. It is a programmers and general purpose editor, and you can use it to take the ruler line off of Word Plus files so another program can read it, and also excise any other characters a PC program cannot handle. Yes, Notepad will do it, but Ultra Edit will do it better.

If using an Atari emulator, Edith is freeware, I think. I have a registered copy. And Edith will do search and replace, fast and well.

Or, get something much better than Word, IMHO, which is Tempus-Word.

I do agree with the details below.

Jim

Sorry it was so long ago that I used First Word+. I moved on to
Calligrapher, which exported as .RTF. That was the way I got my ST to
talk to the PC, via Word, at work.

Hey Jo, have you tried using HSmodem? The patches you are refering to,
are probably the above patch. It fixes some compatibility issues. I am
pretty sure it is possible to make the Falcon's modem port apear the
same as the ST's, but I have forgoten what the patch for that is.
I would doubt you would need a hardware mod of any kind.

Others have suggested converting the files into RTF format and importing
those. After a very quick hunt, I've found a Word+ to RTF convertor that
should run under Windows, using a DOS prompt, at:

<URL:http://www.funet.fi/pub/atari/util/wpls2rtf.zip>

Yes, I'm using HSmodem7. I also tried the serial.cpx to try to
direct to the serial port, but tranfers still do not work.

Thanks for your input.

Can you explain why you are so happy with this game? I'm always looking for new NICE games to play. Perhaps this game (when I could get it) is a nice one for me too, to play.

Thanks
Marius

Hello All,

Well, I have done it.....didn't think I would, but I did. I have ordered a CT60!!!!!!!

I have also bought a huge AT full tower case....lot's of room, and with an AT 300w psu with lot's of power leads. But no 3.5" drive bays. :|

2 questions:

1) I supposed I will have to replace this psu with an ATX psu for the CT60 correct?

2) I'm dumb as a rock, so I just don't understand how to extend the Falcon's ports to the back of the tower case. What I mean is, what cables do I use and how do the plug in to the Falcon's ports? And yes, I have seen all the web sites dealing with this.

Thanks to all,

Sam F.

You can put a 3&#65533;" floppy drive in any of the available bays. Just get the adapter and bezel.

Performance is multi-faceted, but if the best apps for linux performed
at the same level as the best apps for Atari, on similar spec hardware,
then it is reasonable to expect that if either platform can run on
faster hardware, that hardware will give the platform a speed advantage
in computational stuff...

The GUI will spend less time waiting on the CPU, if the CPU gets the
math done faster...

1. Generally, with the Atari software I've used, files too large to be
stored in memory are generally handled by disk caching, as also posted
below by Brian.
2. Anyone with a more powerful system (Hades, CT60, Aranym, etc.)
don't have those memory worries.

> ON Scanning....

Right. I don't consider memory *that* much of an issue, although I
have at times found it a minor limitation, which is one of the many
reasons I'd die for a CT60.

> Funny...My Windows XP PC has 256mb memory or something like that. I rarely do

Yeah. Windows is the biggest memory pig I've ever had the displeasure
of using.

> still be found.
> Keep in mind, your best quality glossy Magazines on the market are still done as
> low as 180dpi.
> Your news paper, 32 to 72 dpi or so.

I've done lots of experimenting with image printing. I often print
photos from my digital camera. On standard papers (ink jet, copier,
typewriter, etc. papers), you just can't get any kind of photo quality

printing anyway, no matter what resolution you print at. If you can live with that poor quality, the ink gets spread out some by the texture of the paper, so higher resolutions don't matter anyway. That's why newspapers print at such low res. Newsprint paper is such grainy stuff. Also, most of what you get a newspaper for is the text, not the images, which doesn't have to be very high resolution to be readable. The images I've seen in newspapers are of only mildly passable quality, just to get the point across. And I don't know about the papers where you are, but the ones here have recently begun using obviously higher resolution imaging than in years past - and they've advertised that fact.

However, if you want to print photo-quality digital images, higher resolutions are a must. I've printed photos at every resolution my printer and drivers support, both on my Mac and on the Atari. Nothing can even come close to comparing to 1440dpi or better resolution. On photo paper, which reduces texture to a minimum, keeping the ink from spreading, you *must* use that high of resolution, otherwise you begin to see the individual image pixels. Even at 1440, you can see them if you look close enough. At these higher resolutions, I've printed out pictures from my digital camera that are so sharp and detailed that traditional film photography can't even come close! So you can't convince me that high resolution isn't necessary. My Atari can't print images at the quality my Mac can, which is why I still use the Mac for that purpose. When/if we get USB capability, and a replacement for NVDI, or even if someone could simply write some drivers for higher resolutions that work with NVDI, I'll happily print digital images on my Atari.

> Today's 1200dpi printers are pretty much a rip off. You can get them for 30

> photo with a 1200dpi printer of today on the same quality paper...and often,
> that of the older printer will be BETTER to the eye. The quality of the paper
> alone has a LOT to do with it!

Not true at all. I have an old 720dpi Canon printer I used to use with my Atari. It never printed as nicely as my 2880dpi Epson on my Mac, no matter what paper I used, and I've tried all kinds. Print photos on real photo paper, and the comparison becomes even more clear that higher resolution is a must.

> When you get into things needing super resolutions....well...for the cost and
> troubles involved, I myself would rather work with FILM! Better resolutions and
> colors.

No. Resolution of film is horrible compared with a good quality digital camera photo at 1440 or 2880dpi on the highest quality photo paper. No comparison at all. Film photography is slightly blurry, no matter how good your camera and film is. Digital photos product a much

crisper image. And really, I haven't found the cost and trouble of high res printing to be all that much more than low resolution printing when it comes to photos.

3957. Seeking: Marpet Xtra RAM Driver By Jim Allen

Newsgroup: comp.sys.atari.st
Date: 2004-06-28 19:20:45 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <64_Dc.2016$4A5.1552@bignews1.bellsouth.net>
Source record: 17952

I've been lucky enough to come across a Marpet Xtra RAM 8 memory board for the Mega ST, and someone was kind enough to send me Marpet's origonal version 1 drivers for the board. I've run into some problems however, and someone informed me they believe other drivers have been done for this board that might fix my problem. Jim Allen, from FAST Technologies was a name mentioned as someone that may have done a driver for this board.

If anyone has a copy of this driver, any drivers other than the version 1 that I have, or knows how to get in touch with Jim Allen, please let me know.

Thanks!
Brian

> correct?

Yes. Definately. Your AT case will probably have a main power switch on the front too, unlike ATX cases that have a low voltage push button to turn on the power. You will need to either replace this on/off switch with a momentary one, or use the reset button if there is one. If your case has a turbo switch you could use this to switch between 060 and 030.

Which ports do you need?

At a minimum youll need the VGA port, get a 15pin HD male to 15pin HD female cable, and mount the female side on a bracket (take one off an old PC video card). If you use the serial/parallel port its the same deal except its a 9pin port. The SCSI depends on whether you want to mount the drives inside or not. The keyboard is a different kettle of fish. I just got a TT keyboard and made an adapter, you could do this, or buy/make an eiffel card.

I'm afraid I don't remember the details, but the modification is very
simple. You just need a better +5V feed to the keyboard port, so look up
the AT keyboard connector on the net, find the corresponding solder pad on
the underside of the motherboard and solder a wire from that pad to a +5V
source on the motherboard. E.g. directly from one of the +5V solder pads
on the power connector which is just a few cm away from the keyboard
connector.

Btw. I've been using a Labtec wireless keyboard/mouse with my Milan for
about a year now, no problems whatsoever :-)

Btw2.: No, you have to remove the motherboard unless you have access to
the underside of it when it's installed in the case.

I thought the GG games were on the 8bit machines, with no real portage
to the ST. I do know it's in the list of the hardest games to complete,
and it's good for a challenge. I've just found it for the Amstrad 464,
but the fact I have to tape-load in each level (5+ mins), to die and
then have to rewind and re-load etc, means I won't be playing it =\

Sure it will. It's simply a matter of how good your display hardware is and how
high your resolution is set. This is a matter of transient technical specifications.
It's simply shortsighted.

> just throwing away memory if you do, because the screen will never show anything
> tighter. If you're going to paper with it....people still very often go way

Humans are very visual creatures and flaws in still images are much easier to
notice (than video). Although, a 450dpi 4x6 in ~450dpi is only going to be
around 1 or 2 Megs anyways.

Sure it will. It's simply a matter of how good your display hardware is and how
high your resolution is set. This is a matter of transient technical specifications.
It's simply shortsighted.

3967. Papyrus X English Demo

Newsgroup: comp.sys.atari.st
Date: 2004-06-29 06:48:01 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <10e245190pjsj5a@corp.supernews.com>

Is there any way to get a Papyrus X English demo? I've been watching their website for some time waiting for the promised demo, but the site never changes. It seems that I remember others talking about seeing a demo.

Thanks!

I suppose you might get the ROM from Atari Workshop, but alternatively you
could consider installing Magic which would give you effectively an English
machine?

Hmm, what about physical keyboard keys, are they the same for UK and German
machines?

The Tempus crew are still adding goodies to theirs, maybe you should
consider moving to a program that's still being supported?

Anyway, perhaps this rumoured demo is only in German?

Hi!

you haven't to purchase anything:)
The tos 4, is multilingual:)
There is utility for keep option
langage, keybord, boot in nvram:).....

Another alternative is to take tos 4.92
on charlelie web site!
It's the very last expï¿œrimental tos from DR:
software only:)
Everything is in the package:)

Another possibility, burn your rom
to put the 4.92
or it still exist
too, burn with magicC rom!
Of course you need to have original
magicC opï¿œrating system:)
(I see that on D.I.Y electronic
hack for atari:)

Bye

Yes - electronically completely the same except for the sticker with the
symbol on. You could simply take an old english keyboard from a 1040 or
the like - should work in Falcon as well if you need english stickers on
top of the keys.
The meaning of each key is software configurable.

I'd think that all you need is a NVRAM utility and possibly change/replace some key-caps around if the german keyboard isn't qwerty. You could most likely find replacement key-caps from most dealers or from Best Electronics (or paint/use stickers of your own for keys that have different symbols).

If it turns out you need to remap any keys software wise....clocky is quite good at this....you can keep up to 3 keyboard configs a hotkey away.

Brian

> Thanks for the info guys! :) What is the address for the web site
> that has TOS 4.92?

Stop before you burn the TOS 4.92 into ROMs! As it can be seen from the version number, this is rather EARLY beta version of TOS 5.0. It for example contains AES older than the last beta of the MultiTOS (1.08), though these were developed in parallel (MultiTOS AES and TOS 5.0 AES is the same AES).

TOS 4.92 works fairly stable, but there are some compatibility problems with some programs.

Also, stop before you burn MagiC into ROMs! MagiC has softloaded VDI drivers, and doesn't boot without them. And that means, that once you accidentally delete your c:\magic folder (with VDI drivers inside), your machine will never boot again :-)

Better stick to TOS 4.04 and switch the keyboard/desktop nationality using the software found on system diskettes.

I thought falcon TOS was Multi Lingual, isn't it adjustable via a CPX?.

Yes it is, all the settings are held in NVRAM. All you need is the
NVRAM.CPX, and bingo, instant French, Italian, English or whatever. The
only reason to change roms is if you have anything other than 4.04.

Hi all.

My landlord has finally severed the 20-year emotional bond with his old computer stuff.

The ST 1040 went into the bin and was collected :-O
I'm sorry, I was too late to grab it!
Yes I know, outrageous wasn't it.
I'll can tell you where he works so we can all point at him and sternly frown as he enters and leaves the building! :-)

Awaiting the bin men next Tuesday is a 30 Mbyte hard disk for the ST.
Disk itself has sector errors and the RTC Lithium cell will need replacing, but the rest of it is probably okay.
If you can get hold of a spare SCSI disk and cell, then you're in business.

I was just in time to grab a bin liner full of ST games.
Mint condition boxes and manuals.

Next in line for the crusher is an Atari 800 XL and 1050 disk drive, an Acorn Atom with 64K RAM board, boxes of XL disks, tapes, books etc.

Buy/collect these items now or they die...

Anybody want any of these?

Cambridge UK area - surely there must be plenty of my fellow nostalgic nerds of a certain age round here?

Cheers, K.

PS. I'm still outraged about that ST! I wanted to do some hardware hacks on it, and he new it!
Maybe he wanted it to have a decent burial rather than have it hang around here in pieces?
After all, most guys would want a dead ex-partner buried rather than resurrected Frankenstein style or butchered and hanging around in vats of formaldehyde. If you disagree, please get some therapy...

I better get therapy then. ;P

I am interested, but I cant' collect. I live in Wolverhampton. However,
I would pay postage. ST games interest me, and so does the hard-drive if
sector errors can be repaired?

that assumption is wrong:) The problem is in the other io falcon use
for serial communication. (mfp vs scc) In the documentation is
attached a picture with hardware modification to modify scc, but i
really don't recommend you to do it if you don't know what are you
doing. I'm working on new communication software, which will work on
st and on falcon as well. Btw 800xl DJ has a bug - it counts sectors
from 0 to SECT-1 instead of 1 to SECT, so the games like MULE (disk
boot version) will not work. (i don't know if it's true in all version
of MULE)

> I also forgot that the OS is multi-lingual too!

hi!

That 's true!

But, something is wrong!
You aren't oblige to have cpx
to change nvram!
Software,on floppy can do the job:)

And another point wrong too!
If, you burn your rom!
It's because you have the kit electronic
to do the job!
So if something don't run!
just erase and burn again!

Not all the tos 4.** have this possibility!
You need to see a little window under the paper:)
To erase you need uv lamp....
You need to unplug the chip.....

It's completly different with eeprom!
You don't need special electronic installation!
For ct60 centronic adaptator and special soft
is require, that all!

It's all the difference for this point
between the ct2 and ct60!

It's true today for agp&pci graphic cards!
Sometime the same card is sold with
rom or eeprom!
It's one point to do choice today!

And the last point, if a hack exist
to put macicC on rom, it's for fun!
I suppose, the conceptor do the right job!
I never test myself!
Of, course, it's a little part of magicC!
it's the thin boot:-) for direcly boot magicC!

Bye:)

Thanks for the reply:)

I like very much MinT!
Could you tell us your opinion of the last evolution
of MiNT kernel!
The conceptor of myaes say it's a bad, no future evolution!

The very last point, it's maybe possible to burn rom
of falcon with emutos, why not, if you want do experiences:)

>matter how good your camera and film is. Digital photos product a much
>crisper image.

I disagree. Some time ago I got interested in this and made some inquiries
into the resolution of standard colour films. It seems that it is in the
one-micrometer range or slightly worse, say twice that much or half as much,
depending on the particular film. Now, for a digital camera to match a 35mm
film, images taken should have the resolution of approximately 2400x3400 REAL
(not interpolated!) pixels, i.e. the camera would have to be in the 8 Mpixel
range (I suppose that 5 Mpixel ones would be passable). Not unachievable
but still pretty expensive. Then there is also the question of the lens
diameter. I did not check, but suspect that with the small-diameter lens
many cheaper digital cameras have, the light diffraction effects in
the small aperture may come into play as well, limiting resolution.

If digital image is to be compared to larger-format films (like e.g. 6x6)
it gets even worse for the digitals.

>at 1440 or 2880dpi

I am inclined to value more the total number of pixels than the "dpi"
value. A larger image at lower dpi, watched from a greater distance
(within reason) would look similar as a smaller image from close-up.
Total number of pixels would determine the amount of detail in the image.
Besides, I suspect that values like "2880dpi" probably do not show real
printer resolution- I doubt very much that an ink-jet printer can produce
dots accurately positioned to, and having a size of 8 micrometers
(only about ten times the wavelength of red light).

I.e. while (affordable) digital cameras are getting better they are still
not the match for (affordable) film cameras of good quality.
Maybe in a year or two...

I agree. I put Magic into EPROMs on a home-made ROM+RAM board- but I made
provisions for TWO operating systems (selectable by a switch; used
2 x 512KB EPROMS). And- as far as Magic was concernedf, providing two
OSses was a waste of time- Magic needs so to load so many files anyway,
that having the main part in EPROMs dosn't make any difference- in fact
I got an impression that, with Magic in ROM, it was harder to recover from
a serious crash.

If you absolutely must process very large documents at fast speed, and
don't care about how the interface looks and don't want MS Word
compatibility, go with Tempus Word. If you usually only work with
small/medium sized documents, like a nice, clean aesthetic look, and
need MS Word compatibility, then Papyrus is for you. I personally go
with Papyrus, as I really didn't like how Tempus worked, looked, and
felt. When Tempus comes up with a product that looks, feels, and
operates the way I like to work, then I'll change my mind on that. It
looked and felt like an older Atari word processor might, not a modern
program. That's of course my opinion. If you like that in a program,
it's all yours!

>> If you have neither patches installed then you are right: MP3 replay
>> quality is poor on these Falcons.
>Nope, mine was modded my System Solutions prior to purchase...

Could you take a closer look at the chip that was installed by System Solutions. If it is a 74F08 the chance is high that this didn't cure the symptoms. There are a lot of clock patches around that are wrongly fitted (even it they have benn installed by ATARI themselves) :-(

Anyway, the best solution is to remove the clock patch (install the smd resistors back) and install a simple 68 ohm resistor instead at your SDMA chip. Rodolphe Czuba did a lot of research and he finally find out what the reason for bad sound quality was. Take a closer look at his website. :-)

>The GUI will spend less time waiting on the CPU, if the CPU gets the
>math done faster...

If the GUI wastes cpu power like e.g. Windows does it even doesn't help to have a cpu that is several hundreds times faster than a 66Mhz CT60 cpu.

I already told the example of checking emails but there are a lot of other examples where I do not recognize the speed difference, for example scanning fotos or surfing the web (I only have a dialup connection).

4004. NAS 2004

Newsgroup: comp.sys.atari.st
Date: 2004-07-02 10:05:19 UTC
From: Mille Babic <atari@sverige.REMOVE.nu>
Message-ID: <1088766838-69243AEicMi@sverige.REMOVE.nu>
Source record: 17999

The Swedish Atari Users' Association (SAK) proudly present
and invites you to:

THE NORDIC ATARI COMPUTER SHOW 2004 (NAS 2004)

Where: Gothenburg, Sweden.
Samskolan, Bï¿½ltgatan 8
400m north of the New Ullevi Football stadion
When: 10th of July
Opens 10 pm and closes 20 pm CEST
What: Mostly ATARI users from Sweden bring their computers
LAN with Internet
Cost: 20 SEK, 2.15 EUR
Info: More updated info at http://www.sak.nu/nas
maps etc
E-mail: mrfuture@home.se (Andreas Sjï¿½ï¿½)
atari@sverige.nu (Mille Babic)

Dear Atari friends, now it is only two weeks to NAS2k4.

It's once again time for the Nordic Atari Show, the annual get together
which has rapidly become a fixture for all Atari users.

We arrange the show for the tenth straight year we hope to fulfill
everyone's expectations and that this will result in the best possible
atmosphere.

In den letzten 10 Jahren ist die Nordic Atari Show zu einem festen Event
in der TOS-Szene herangereift, der mit jedem Mal besser besucht wird.
Austragungsort sind die Samskolan Gï¿½teborg in Schweden. Veranstalter ist
die Swedish Atari User Association.
Gesucht werden weiterhin Atari-User, die Vortrï¿½ge zu bestimmten Themen
halten mï¿½chten.

This year the show will be held in just one day 10th of July, but will be
open from 1000-2000, maybe longer. For the second year we arrange NAS in
the big summer vacation period. Now you can combine a visit to us with
a nice stay in the summertown of Gothenburg. It's easy to get to Gï¿½teborg
by car, rail, bus, ferry or air.

Mille Babic
The Swedish ATARI Users Association

> Could you tell us your opinion of the last evolution
> of MiNT kernel!
> The conceptor of myaes say it's a bad, no future evolution!

Well, I consider the integration of an AES with the kernel as a bad idea. Obviously, the current design of the multitasking AES is even worse, and there was a must to do something ith it. There was possible movement in two different directions:

1) integrate the AES completely (with all the routines) into the kernel and let it go with usual kernel privileges (supermode etc.).

2) integrate some absolute minimum part of the AES into the kernel, and put the AES libraries together as user shared object.

I'd like the last way, while the things go the first way now. However, no doubt that this improves the current situation (provided that Ozk will completely debug the XaAES, which is, and always has been so far, rather unreliable).

And well, so far nobody is obliged to use XaAES, integrated or not, fortunately. I am afraid that this will change, though, because current AESes use some hack (well, "documented kernel feature", which was introduced solely to make possible the misconcepted AES 4.0 work), that very badly endagers the system stability and safety. Ever seen "Operating system killed"? That's it.

The separate question is famous WDIALOG, system font selector, nonblocking fileselector etc. MagiC integrates all this into the OS kernel, and that was one of the most idiotic concepts ever, because this stuff should rather go as shared libraries comprising more complex functions. But well, that's MagiC.

However, mimicing this in XaAES is even worse. The effects will be:

1) the AES implementation will (forever) become very difficult and complex, because programs will rely on presence of these complex functions at trap #2;
2) the OS kernel (or the AES kernel module) will become very large;
3) we will never get to develop proper AES libraries, if everything will be thron into the OS;
4) the user will have no choice.

By that last, I mean that you'd have to change the whole AES (for "change" I mean, that you, as an user, will have to switch to another AES implementation), when you want to change just the fileselector. With properly designed AES (a combination of kernel interface and a set of shared

libraries), you'd have to change just one library.

Summing up, I don't like the direction things go now, but at the other hand
I realize that this most probably will improve the current situation (which
is very bad).

Well I managed to get all the bits required, managed to get the ET400
card itself for 5 euros, not a bad deal:)

> It shouldn't be that difficult or risky.
> In my opinion...for a non portable recasing, the bigger the case, the better.

Haivng got the Panther and ET4000 setup, and looking at getting an
Ethernet board as well, I've decided it's gonna HAVE to be recased to
be usable on an everyday basis, have got a full tower ATX on order,
but this is where questions come in...

I have a Megafile 30 hard drive, completley unaltered. I want to put
that along with the rest of the system in the tower. There seems to be
something stciking the case though, so I can't open it up fully
(wihtout breaking the case) to get a look inside to see how feasilbe
it would be to remount everything. I know the drive itself is a
santdard 5"25 so I'm guessing there should be no problems???

I like that about it, but hte bloody megafile's PSU is a pig!!! Be
glad to see the back of that.

> 2. Port access....

I'm hoping to simply bve able to mount the board at the edge and drill holes for the ports. However if that's a no no, just how much soldering is involved to pig-tail them? My last experience with soldering was grim, so trying to avoid it where possible.

pdlg.slb is the WDialog part in MagiC 6.10, afaik. Isn't it a so called
shared library?

I believe he is intending it to come to the STe eventually.

What advantages are there with SCSI? I forget.

Coda.

Just a note: the PCB track is intentionally kept this thin to act as a fuse
in case of a short circuit - there was no space for a real fuse. I have
rarely seen Milan boards with the track open, so you should be able to keep
everything as it is as long as it works - you only need a wire in case you
blew the "fuse".

Hi, hello pascal:)

Yes, but no!

I always use wdialog with my method!
First install magicC!
Then install nvdi
Then erase wdialog
And put the very last version of wdialog!

I always do that and everything run:)

For MiNT it is diffï¿œrent, i always use mï¿œthod of M seimet!
(it's order to respect for installation!
So the wdialog is only associate with nvdi:)

Hi all!

I have answer from the developer for this point:)
No trouble electronic or compatibility!:)

It's just how to find area for the card in ste!?????

So all suggestions for the implementation
of the card are welcome!

The card need direct acces of the processor
and power too:)

Just see the news snapshot on the website:)

I can't imagine what would be sticking the case....
Double check you've removed all the screws from the bottom....sometimes a screw
is hidden under a sticker.
If you've got all the screws, the plastic lid should pop right off.
Next, will be a RF-Shield. It uses little bend tabs around the edges, and
possibly some screws.
As for mounting this baby inside your tower.....
It all depends really....
If you have a true Atari Megafile rather than a dealer built job then you'll
find a really large ASCI to RLL host.
This will connect by two ribbon cables to a 5.25" RLL drive mech.
The Power supply will partially cover your host.
This is a BIG host....you can remount it it the tower provided you can find
space for it. If you use a differnt power supply, take care to match up
voltages properly!

If you do have a true mega-file, and trying to remount it drives ya
batty....remeber you can always just bolt the whole thing...case and all...to
the side of your Tower and be done with it.

If you're lucky....you might have a dealer built hard drive in a Mega File case.
In this case, you'll have a much smaller ASCI to SCSI host. This will connect
to a SCSI hard drive by a single 50 pin ribbon cable. The drive might be 5.25",
or even 3.5". This would be a much simpler kit to remount, and would also
support up to 7 easy to find SCSI devices. Such a host usually only calls for a
5v power supply from a floppy disk type power connector.

> I'm hoping to simply bve able to mount the board at the edge and drill
> holes for the ports. However if that's a no no, just how much
> soldering is involved to pig-tail them? My last experience with
> soldering was grim, so trying to avoid it where possible.

It all depends on how much of a perfectionist you are....
If it turns out you can't position the mb in a way the ports can just be cut or drilled out....then it's really up to you how fancy you'd like to get. A lazy, but very reliable and easy approach is to simply purchase ready made extension cables and let them hang out of the case somehow (through a card slot hole, or one you drill/cut). If you want things to be proper and neat....you could cut out and mount your extension cables to the chasis.

If it were me, I'd be inclined to make one big hole/slot somewhere, line it with a rubber gromlet, and let all the cables just enter the case and plug in where they go.

Depends on the beholder's eye.
Judging from recent exhibits, one could put Damien Hurst on an unmade bed,
ram an old computer up his output port, chainsaw the lot into slices, and
give it a title like "Artist auto-sodomised by his own art".

If you're Tracy Emin, you might get 50 grand.

Most other people would get life without parole in a psychiatric hospital...

>a software from M SEIMET;-)

Hmmm, it depends- which machine, ROM and which RAM. On MC68000 Ataris (ST, STe, Mega, MegaSTe) operating an OS from ROM can be just a little bit faster than operating it from ST-RAM, because there are no intermittent waits for RAM refresh, and also, data-acknowledge can be produced immediately. At least I found out that it was so with my home-made TOS 2.06 + 8MB AltRAM board. I am not sure, but it may be that when original (built-in) ROMs are used, data-acknowledge (created by GLUE, iirc) is delayed for several cycles (longer than necessary) so that the (older/slower) ROMs can produce valid output. If so, THAT can be slower than RAM access.

Of course, anything ran from FastRAM, on machines which can support it, will be vastly faster than ran from ROMs.

During the testing of my board, I first installed TOS 2.06 into ST-RAM (before running it from EPROMs). All benchmark tests which I ran very consistently gave about 2-3% better results for anything ran from (new) EPROMs or AltRAM than from ST-RAM.

Btw. a correction: my board used 2x256KB EPROMs, not 2x512KB as I wrote earlier.

I do not see why the program as it is would not work on the falcon. The falcon version must require the falcon hardware because that version crashes my Hades. I am wondering if Joe is trying a later version of the program. I have an older version that I use on my Hades and it works fine. There is a later version that I tried and it did not work at all. Goto the site below and download the package. This is the older version and it may work. If it does, email me for some nice DI images.

Yes I downloaded it from their German site I believe. It was still
fund to use eventhough I could not read anything. There may be an
English version on the English side. I have my upgrade. Works
great for me....

Is that the PCB with a PLCC44 socket for the Codec and connections for 6
Cinch audio connectors?

If yes, then the mod replaces the whole analog audio path in the falcon with
something more suitable for real audio use. You still have the limitations
of the Crystal/ITT codec (about 90dB SNR IIRC), but it works a lot better
than the original circuit.

Basically, you have to remvoe the codec from the falcon PCB, connect the
Soundlifter to some pins on the falcon PCB where the codec sat, plug the
codec into the soundlifter PCB, and drill holes in the back of the falcon
case for the 6 connectors.

>range (I suppose that 5 Mpixel ones would be passable).

I disagree with the original statement too. In fact, according to
Kodak a few years ago, a 35mm medium-speed 36*24mm negative has an
equivalent resolution of around 20 Megapixels. Since then, many film
materials have improved their sharpness. They also have a much
longer tone-range. Also, single-chip cameras have a restricted
colour sensitivity - 3-chip cameras are much better, but only found
on top-end models.

However, many video and digital still cameras apply image
processing that artificially sharpens the contours, which makes the
image look sharper even though the actual resolution (i.e. the
fineness of detail that has been recorded) is fairly low. (It's
done by boosting the high frequencies of the signal in a video
camera, and something equivalent in a digital camera.)

Regards, /Peter/

> >matter how good your camera and film is. Digital photos product a much
> >crisper image.

1. Take your little joycam back and get a good quality 35mm, or bigger, camera.
2. Take your film back and get the appropriate speed and quality.
3. Read the instructions carefully on your camera if it's an auto job...some
are MUCH better than others.
4. If it's a manual job....learn what the settings do.
3. Use a decent lab when developing.

If your film is 'blurry' then you have bad film, lenses, or have not focused
properly.
The film itself records what is projected on it....at dern near microscopic
levels.
If you wish to 'sharpen' it up with a scan and digital rendering, then you are
actually 'redrawing' the photo, and REDUCEING the resolution to something the
eye percieves as 'better'. My point all along about people often overdoing
resolutions with typical document printing.

There's no way a typical digital camera comes even close in terms of resolution
and color range as film.
It may be that with some electronic based filters and enhancements, that your
eye prefers the digitial rendition at much lower resolutions....which prooves my
point about people often going overboard with scanning and printing resolutions.

There is a point where too much resolution is a waste. Unless you are ARCHIVING
things that you think you'll do many projects with in the far future....in which
you'd want as true to life quality as possible.

I still maintain that a 720dpi printer that microweaves and such, on a Falcon,
set up properly, can produce nice quality photos on the right paper. Certianly
as good or better to the eye than most of the garbage my friends print out on
their PC machines. By the time the thing goes in a picture frame and is put on
the wall....well....lets just say you'd have to get VERY CLOSE to tell a
difference.

There also comes a point where staying with film gives much more for the money....even with the labor and lab considerations. Alot of work and equipment goes into digital imagry as well....so the 'labor' issue leaves alot of room for debate over which is more cost effective. ESPECIALLY in motion picture work. It really depends on what you're doing!

For typical journalists...it makes sense to use digital, as one can zap the photos back to the publisher over wire or air instantly. Things designed to go directly to the TV medium...it also makes sense to use video or digital. For art, motion picture, and portriate type work, a good mixture of the mediums is likely most practical.

For special effects and animation, it makes good sense to use digital....or a mixture of digital and film. Time and money are all factors......

If I did much of this type of work with images, no, I would not choose my Falcon over currently avilable options.
Instead, I work mostly with MIDI...and the Atari machines work at 3 to 5 times the resolution as the typical PC package where MIDI is concerned. To get into software and hardware on a PC that matches up, well....one could buy an awful lot of used Ataris on Ebay! Since I don't do much on the audio end....it just doesn't make sense to upgrade to a Pro Mac or PC setup. It would not save me any time or money at all. If I do need some fairly high end audio...I just borrow or rent a stand alone recorder and sync it to what I've got. Better yet, I go to a pro studio, make music, and let the engineers worry about the technical headaches ;)

some years ago [1996] Robert Best had a conversion prg called WP2:

WPxx.TOS contains

WP2.APP converts 1st WordPlus 1/2/3 text to WordPerfect 5,
and WordPerfect 5/6 text to WordPlus format
WP2_D.DOC Deutsche Anleitung, WPlus Datei
WP2_E.DOC English manual, WPlus file
WP2_N.DOC Nederlandse handleiding, WPlus bestand
WP2_READ.ME this file
TEST.DOC WPlus test file

Figures extracted by WP2.APP from WPerfect files can be viewed and
converted by aid of WPG.PRG - see WPGxx.TOS

xx indicates the version

Should this be of any help, then I can send it over...

Well, there was that American criminal who agreed that his executed body could be frozen, sliced into 1mm thick sections and scanned for the 'visible human' project.

Would a Damien Hurst salami pickle be a case of art imitating life (or more correctly, death)?

Apparently the yanks had to wait a long time for the right subject.
They should have just advertised on a German cannibalism fetish site,
under the frozen food section.

What revisions of Falcon motherboards were produced?

I've come across A, B, D/C but I've heard of pre-production
motherboards and revisions 1-4. What are their differences?

Is a revision A motherboard with TOS 4.01 worth acquiring or is it too
crappy?

The best Falcon I've ever owned was an MKII Falcon with what I assume
would be one of the latest batches of motherboards.

The most incompatible and problematic motherboard for me has been a
revision B with TOS 4.02. I have not owned a Rev. A so I'm assuming
it's even worse... right?

Joshua.

PS. For those who want to check their revision number, look on the
bottom left corner of the motherboard. There's a sticker there with
the number/letter.

Hmmm, that means the grain size of about 0.6 to 0.7 micrometers, i.e. I was
even a bit pessimistic on the quality of a standard 35-mm negative.
On the high end would probably be the holographic film emulsions, with
grain size several times smaller than the wavelength of visible light
(which is in the 0.4 to 0.8 micrometers range).

>Also, single-chip cameras have a restricted
>colour sensitivity - 3-chip cameras are much better, but only found
>on top-end models.

That more-less agrees with what I have heard- that GOOD digital cameras
exist but are (still) fairly large boxes with a price tag in the range
of 10000-100000 USD.

>However, many video and digital still cameras apply image
>processing that artificially sharpens the contours, which makes the
>image look sharper even though the actual resolution (i.e. the
>fineness of detail that has been recorded) is fairly low.

And that would store some nasty surprises for the user, if he tries to
extract some fine detail from a picture using extreme magnification ;)

The advertisements for common digital cameras usually state so-many-
EQUIVALENT pixels (meaning the result of internal signal processing and
over-sampling), with real number of pixels usually given in fine print
on the last page, or not at all.

A visit to a good photo exhibition might be educational- there one may see poster-sized photographs, on which sometimes detals can be explored using a magnifying glass- especially if they are black/white photos.

Btw. there some other aspects interesting for comparison of digital and film cameras. For example temperature-dependent sensitivity- it exists in both, but, AFAIK is much worse in digital ones: sensitivity generally reduces, and noise increases, with the increase of temperature, and v.v. For example, the people using the digital still cameras for the amateur astrophotograpy sometimes go out in the extreme winter colds and leave their equipment to cool for several hours before commencing shooting, in order to get the highest sensitivity and least noise.

On the matter of noise: unevenness of quality (sensitivity, zero-offset or even complete failure) of individual pixel sensors in digial cameras makes it sometimes necessary to take "dark frames" and "white frames" (i.e. calibration datums) which should be digitally subtracted from the pictures to be processed, if sensible photometric data have to be extracted from the images.

We do agree, that Tempus-Word will not win a design price, because of it´s old fashioned look. This will be part of our "harvest update", to get our highly sophisticated functions into a smart suit. Up to now we saw TW as a tool like a hammer: it will never win a price for looking good, but it´s very suitable to drive nails into the wall. That´s what we designed it for. Not for looking nice.

> If you usually only work with small/medium sized documents, like a nice,
> clean aesthetic look, and need MS Word compatibility, then Papyrus is
> for you.

TW supports RTF format. This is the required compatibility. If I need MSW compatibility in behaviour or look, then I should directly use OEM MSW from harddisk instead of buying another word processor. One of the main reasons for TW is, to be _different_ to MSW.

> I personally go with Papyrus, as I really didn't like how Tempus worked,
> looked, and felt. When Tempus comes up with a product that looks, feels,
> and operates the way I like to work, then I'll change my mind on that.

Tell us, how you´d like it, or more concrete, what you do not like. As we are going to change the look of the interface we are very interested in the needs of dedicated people, working with our application, trying to get a tool for their personal needs instead of another clone of MSW.

> It looked and felt like an older Atari word processor might, not a modern
> program. That's of course my opinion. If you like that in a program,
> it's all yours!

We appologize for hiding our powerful functions behind an outdated interface. We will change this within this year. Everybody is invited to tell us his personal interests to a word processor, he/she´d like most! We try to gather this input into our next updates.

For taking part in our permanent survery you will get a voucher to the value of 15 € for the purchase or an update of Tempus-Word NG:

It's defintely an Atari system. Atari branded hoast board (gigantic
and with a frighteningly complex power supply arrangement) running to
a Seagate branded 5'25 drive. Should be able to mounted though, theres
plenty of space inside, just crossing my fingers I can get the power
supply hooked up right.
> If you're lucky....you might have a dealer built hard drive in a Mega File case.
.....This would be a much simpler kit to remount, and would also

>Just a note that I did release an updated newsie based on the .961 source
>code.

Hi;

Sorry, not everything is well in this new version. If an e-mail contains
text "", Newsie now opens the message in two windows- one is plain
text, and another is obviously supposed to be a display of the html content,
but this doesn't work well at all, and results in garbage on screen (writing
out of window borders, etc), display (instead of interpretation) of
"unprintable" characters such as CR or LF, etc.

As (unfortunately) a large percentage of e-mails today come with this
idiotic html section, display of that should better be disabled until it
works correctly (maybe there is something undocumented in the
configuration file for that?)

Btw. Lonny, there is (in V0.961, at least) a quite unpleasant bug in
receiving e-mails, which probably would be easy to fix: it seems that if
an incoming e-mail does not contain any text after "Subject:", then it does
not get included in the Inbox! The message is received, it the file
is in the directory, but it does not get listed.

Yes, I'm interested in learning enough bits to do the following....

1. A tos only telnet client for STiK/STing that can be run under the console/emulation of choice. I.E. run inside the CoNnect termianl via CoSHY, TOSWIN, GENEVAWIN, or directly from a console or vconsole.

2. At some point, I'd like to do a really nice TosWin type application that can run without MiNT, and has speedy vt102 emulation or better with full extended ansi color. Included in this terminal emulation package might be drop down menus and or hotkeys where one could call tos apps with optional preset command lines. I.E. You're working over a telnet connection, and wish to set a block of text and run a spell check....you might have a tos based dictionary, that you can call quickly and easily with your drop-down menu...that's smart enough to launch the dictionary, and cat all this selected text into it.

3. To possibly port some unix/MiNT-Net clients and servers to run with STiK/STing.

4. To make a MiNT-Net driver for the Dynaport SCSI/Link ethernet device.

5. Possibly a protocol/driver to send and recieveTCP/IP over SCSI in a way that can be integrated into the networking route.tab of MiNT, MagiC-Net, STing, and STiK. Kinda like PLIP, only MUCH faster! If SMIDI is possible, and apps that support it such as ZeroX do nicely in most if not all of the TOS environments, then why not a SCSI based TCP/IP stack?

If these things already exist somewhere....please let me know! Been searching for over a decade now ;)

If not.......
I'm not sure where to even begin! I.E. what language would be best? What do I need to find and study first in order to accomplish these goals?

I have here a Falcon CT2b with EasyMiNT installed. A Mega ST4, STacy 4, and a Windows XP box.
The only programming tools I have are whatever is with MiNT, and a really ancient version of Mark Williams C...who's shell won't even run on the Falcon! MWC does still have the huge lexecon with it, but the functions listed in it all look greek to me. I can understand there might be alot of hours of making simple, "Input: "What is your name?" type test apps to learn about and accumilate a workable library......but I'm not even sure where to start. Tips, experiences, and encouragement are all welcome.

Thanks,
Brian

Bonjour :)

I would like to put a graphic card on my MegaST, which is used for coding. I have a viking card (http://www.maedicke.de/atari/hardware/sm194.htm) but it is no use coz i do not have to suitable monitor. Maybe i can give or sell this viking card.

Anyone has de Crazy Dots, Matrix M128 or C32, etc for MegaST 68000 port (= MegaBus connector) ?
Would like to have TT rezolutions for GFA coding (1280*960*2 or 640*480*16).

Thanks

That is right. This problem appears only in V0.962. Maybe you in fact
obtained some post-0.961 code with containing experimental new stuff?
Or some #define is differently set in your compilation?

I have just tested it. There is no need for the message to contain
"begin" etc. Having is enough.

To stimulate some disscussion:
What are your favorite and most innovative upgrades/additions to Falcon (or ST/TT for that matter). For me some simple things like a new quiet ide drive, parking my noisy SCSI drive when not in use, and adding a silent power supply really helped my Falcon. It's mounted in a Wizztronics Falcon Rack and it used to sound like an airplane taking off before I made these changes. I also added some foam to the inside of the case. How many have built their own ethenec? I would love to try one, but haven't got any response in buying one. I'm using the Daynaport SCSI link T, which works great but only has STing drivers. I can't install MINT until I have some other solution for ethernet (or MINTNET drivers for the SCSI Link).

Lyndon Amsdon, if you are listening, I would be willing to take responsibility for producing the ethernec if you would help me get started.

CT2b....
While mine has not performed 'perfectly' as of yet, it's amazingly FAST!
Extended video resolutions!
Improves speed of CPU, FPU, DSP, and System Bus!
Provisions for up to 128mb of Fast RAM.

I highly recommend one of these, or better yet a CT60! I would get a CT60, but ya know....I'm still paying for the 2b ;) And such is life.....

FPU...
A big help for applications that use this.....

FDI...
For the Digital ports.....
I use an Art D/IO box for typical A/D-D/A conversion. This D/IO box also provides a plethora of sample clocks which can really come in handy. Can also hook this to S/PDIF equipment.
Better than what's built into the Falcon! There are plenty of things on the market that do the same thing as the Art D/IO device. I chose this one because it has an adjustable tube preamp built in (can also be bypassed).

If you don't need S/PDIF....I still highly recommend an external sample clock of some kind for any Falcon user who's at all interested in recording/playing audio files with the Falcon. I.E. With a 44.1khz sample clock on the DSP port, applications like Aniplay do not have to resample while playing.

FA8: Nice if you need extra audio outputs.

I have the Dynaport as well....
I do wish a MiNT-Net driver existed!

I have an eNEC setup as well.....and it's a real blah since half the things I wish to run in a Falcon session require dongles of some sort.

Brian

The things that go wrong with that model are not detected by a bad sector
test. You might try typing the part number in a search engine window, and
see what some people think of it.

You may have a good one. I had eight of the things, and learned a lot
about what goes wrong from them. I do wish you luck.

So plug it in and try it. With a proper active termination adaptor, it
will work if it can. But, I would advise current backups.

Jim

hi!

well, 2 usb 1.1 12 mb/s if i read the doc:)

Well, it's developpement or it's another
possibility?????
What's about drivers, do you have details?????
What's about price, disponibility and so on.....

All details are wellcome......

Bye

Or just get a decent digital camera. The 5 megapixel Kodaks are quite
nice for the casual family photographer.

The overhead of all of this will likely not make it worthwhile. You're
escalating the material and labor costs for the entire enterprise.
Expecting the common "snapshoter" to be a wannabe photojournalist is
just going to introduce more opportunity for errors.

[deletia]
> There's no way a typical digital camera comes even close in terms of resolution

> point about people often going overboard with scanning and printing resolutions.

The differences between 1, 3 & 5 megapixel images are more than noticeable
enough for typical consumers to notice. Even at 5 megapixels, image clarity
is going to be such that obvious distortions can be seen.

This is very much like 128K MP3s.

>
> There is a point where too much resolution is a waste. Unless you are ARCHIVING
> things that you think you'll do many projects with in the far future....in which

> you'd want as true to life quality as possible.

If this is the metric then the novice will probably get better results with a decent digital camera. There are simply fewer variables to consider. Quality of film and processing are taken out of the equation.

[deletia]

One thing the conventional cameras still have on ditigal is speed. You can consume an entire roll of film remarkably quickly with an analog camera (compared to digital). However, this exercise consumes money as well.

My Kodak gives me 180 free chances to get it right before I have to start thinking about deleting pictures.

USB 2.0 low (1.5) & and full speed (12mbits)

> Well, it's developpement or it's another
> possibility?????

One more....

> What's about drivers, do you have details?????

Nature will be doing the Ethernet drivers, I will be coding the USB stack.

> What's about price, disponibility and so on.....

See Rodolphe Czubas announcement on Nature's behalf. If youre on the mailing
list you should have it by the time you read this.

> All details are wellcome......

And theres still more to come ;-) Its gonna be a good year for Atari.

Coda.

NO. USB 2.0 does not mean High Speed (480 mbs). Thats the type of
misunderstanding that gets perpetuated in the ignorant PC world. USB 2.0 is
a the later that 1.1 set of specifications that INCLUDES High Speed. For a
Device or Host to be USB 2.0 does NOT mean High Speed. see
HTTP://www.usb.org/

> > Nature will be doing the Ethernet drivers,
>

Excellent! For me it's fine as m STe is recased with an ATX PSU, but if you had orginal case I think (assuming the production version of the board will be relativly small) you could get round it if you got rid of all the shielding around the M'board, on the orginal case styles it was a bit, you know, excessive to say the least.

But just got to get my hands on one of those boards! 14mb RAM and 32Mhz CPU with TOS upgrade, too much fun:)

Power access would be the problem on standard STe, though I guess if somsone wanted to there is no reason they couldnt rig up an external modern PSU and just run wires in, or recase.

Only thing is, if you already have an upgrade that needs to plug into the CPU. I've just got my Panther upgrade which does just that, and most likely those looking to extend RAM beyond 4mb, IDE and overclocking, are also likely to have something like that plugged into their CPU. If there was support for ISA expansion on the card that would be ideal, as you could have network, graphics, memory expansion, TOS upgrade and IDE support all on one board. Because of the location of the board, having the actual slots elsewhere linked though IDC cable would be ideal, as having the VGA out port and ethernet card in the middle of the motherboard not much fun at all when trying to plug in monitor...

I have a Migraph Wand with the sheet feeder. It's connected to my MegaST4 (Adspeed, TOS2.06, Warp9). I quit using it after attaining a color scanner for a PC. The Mega is just to slow for this application. I fall asleep and forget wether I just scanned or saved the file to HD. For a lot of the things I scan the Wand would be better than the flatbed.

Was anything ever developed to attach this to a Falcon? This was the biggest disapointment of buying my Falcon. If so is their enough speed increase to warrant the change?

I seem to recall Migraph was selling an adapter to use this with a PC. Is it still possible/practical to do this? What hardware and probably more importantly software could I use to do it?

Thanx

And there is no need to solder at all, you can get all (or nearly all)
connectors as a variant to press onto a flatband cable. Perfect for
those not used to soldering. Just have a look at Digikey

Hi,

I have compiled Mplayer-1.0pre4 with SDL (thanks to Patrice Mandin for his work), you can read or convert DVD, today uncrypted (we need the css support inside Extendos, but I wait good news from Roger Burrows). This archive works on MiNT or MagiC in GEM window or with xbios fullscreen. Configuration mini CT60-100 or Aranym (?) but we can always convert the movie into another format (68020-60/FPU). Aniplayer can read DivX ;-)

http://perso.wanadoo.fr/didierm/files/MPlayer-1.0pre4-atari.lzh (3.47 MB)

Good tests !

Regards,

Didier.

You will want IDC (Insulation Displacement Cable) and the appropriate number and size of IDC D-way connectors to suit your project. I'd probably get a length of cable with enough wires for the widest connector and split it to fit the smaller ones.

Insert the cable into the back of the socket, you can see how the bifurcated teeth will bite into the cable - then stick it into a vice and squeeze it up. Job done.

Use a SHARP knife and a straight-edge to cut cable to length and use the red stripe to identify pin 1 connections.

I tend to cut the cable after both connectors are clamped onto it, you can
run a sharp knife down the rear of the connector to cut the cable off clean
(try not to cut into the connector).

Coda.

Okay,

Let's see if I understand this:

Let's use the printer port as an example.

Let's say I pull a printer port from an AT case. Now, I cut the end of the cable that attached to the pc mb, and replace that end with a 25 pin male connecor. Then, I just plug that end to the Falcon's printer port and the female end goes to the back of the pc case.

Have I got it right or am I way off?

Thanks,
Sam F.

>

If anyone can tell me what this damn thing is called i'll be happy, but here
are my insane ramblings....

Firstly:
The small white box has a GAL inside, I think it takes the 32mhz clock from
the DSP and divides it down to 500khz. The only reason that you need a new
500mhz clock is because if you change the main Falcon clock (32mhz) the
clock to the ACIA's is not 500khz anymore, so your keyboard/mouse and midi
wont work.

Secondly: (I must have been really tired when I posted last...)
The second white box is sitting on the memory port. There must be some
memory in there, so I surmise that its either a combined memory
card/accelerator, or its just a memory card and the accelerator has been
removed. I reckon its the second possibility as:

1. If you built a combined accelerator/memory card it would most likely be
bigger that this.
2. You wouldnt need to have a seperate 500khz clock, you would build it into
the accelerator.
3. In order to sell the falcon to you, the owner would have most likely left
the 500khz clock circuit in because its too much hassle for most people to
remove. (But that doesnt explain the missing accellerator, as it would need
more soldering to remove).

Thirdly.
U65 is "one" place for the main 32mhz system clock crystal. It is missing on all the falcon motherboards I have seen. There is another smaller footprint 32mhz crystal elsewhere on the motherboard so it isnt needed (maybe Atari originally were going to run the CPU and bus at different speeds and decided against it later on).

I would suggest getting Gembench and Nembench and seeing how your falcon compares to a stock falcon.

A far as the CT60 is concerned - You can just add the CT60 without doing any soldering, and it WILL work fine. Most people will do this first just to get it working, then some of us (inc me) soldered it in later. The point of the with solders install is that the CT60 also has the functionality of a Bus, DSP, and FPU accelerator and also has a new 500khz output for the ACIA's (which is the same as what your little white box does).
If you do the with solders install then leave the 500khz clock box as it is, but do install the rest of the CT60 as per the manual on http://www.czuba-tech.com/

Coda.

Yes thats more or less it. If you already have PC brackets then use them,
though I would suggest pulling the hood off it and checking that the pins
are wired up how you expect:

PC end (female) of printer cable looking from the hood side (where the cable
goes in)

1 2 3 4 5 6 7 8 9
10 11 12 13
14 15 16 17 18 19 20 21 22
23 24 25

Now if you look at the cable, the red stripe will be connected to pin 1
right?
Well the next strand of cable wont go to pin2 but to pin 14. Check this
inside the hood.
I have seen strange wirings where the first half of the cable from the red
stripe inwards is attached to 1-13 and the second half is split and goes to
14-25. If it looks like that then BIN IT.
If you get the IDC 25way male plug you can just feed the whole 25 width
cable into the plug and clamp it. Make sure that Pin 1 is on the red stripe
and you CANT GO WRONG.

Coda.

Hey Coda,

And that's all I need to do for the primary ports....modem, printer, scsi, video, and enhanced joystick ports?

Also, is there any reason to extend the dsp port? I am not a musician.

Furthermore, I don't plan on the cartridge and/or the midi ports.

Thanks a bunch!!!!!

This is the kind of info I was looking for....info and some instruction/guidance.

> And that's all I need to do for the primary ports....modem, printer, scsi,
> video, and enhanced joystick ports?

Well the enhanced joystick ports are the same type as the video so just do 3 of these (2 a bit longer obviously).

The scsi could be a bit of a problem if you want that connector taken to the backplane. I guess most people would just get a male 50pin scsi D plug and put it on one end of a 50way ribbon (IDC) cable and then put a 50way header on the end and at various points on the cable to attach devices like internal hard drives and CD drives. If you are installing the falcon in a full tower, this is probably the best way to do it as youre less likely to want to plug any external scsi devices into it. If you do want external scsi, then you must get a 50pin scsi female plug on a backplane and the external device MUST be terminated, and any internal devices must have termination off or disabled.

> Also, is there any reason to extend the dsp port? I am not a musician.

No and most musicians dont use this port either, just the few that run cubase audio and also things like aniplayer, or anything that uses the 44.1khz audio clock. If you do need an audio clock, open the case, plug it in, close the case and forget about it.

> Furthermore, I don't plan on the cartridge and/or the midi ports.

Same for the cartridge port, open case, plug it in, close case. If you dont use the midi then forget about them.

> Thanks a bunch!!!!!

You caught me at a time where I was at a loose end so no problem.

4097. CT60 Newbie Help

Newsgroup: comp.sys.atari.st
Date: 2004-07-14 05:51:36 UTC
From: puffpuffin@aol.comNOSPAM
Message-ID: <20040714015136.05710.00001545@mb-m14.aol.com>
Source record: 17894

Hi everyone,

I've finally gotten around to installing my CT60 in my Falcon. (I got it last October - yes, I've been that busy :-|) I plugged it in (no solders) and installed HD Driver 8.13. All seemed fine until I tried Aniplayer and I got no sound. Then it would crash playing certain files. Next, I noticed a blinking cursor in the upper left hand corner of the screen. Wierd!

I checked the CT60 web site, and it looks like my ABE/SDR chips are out of date. My ABE/SDR chips are marked 5K and 5D. Now, I'd like to update them and see if it fixes the problems I'm having. However, I don't quite understand how to do this. What are flying lead connectors? Where do you connect them on the JTAG cable? The pictures on the Xilinx site aren't very clear for a newbie.

Actually, the easiest way that I found was in the latest MyAtari magazine article "CT60 Essentials" that mentions a cable built/sold by Andreas Pettersson. Does anyone if he still sells these and how to contact him?

My CT60 also came with 3 things that I don't know what they are for:
1. a resistor (I guess for flashing the ABE/SDR without unplugging the CT60)
2. what looks like 3 surface mount resistors marked "3360"
3. a ribbon cable with a 10-pin female head (which looks like it plugs into the 10-pin male port on the CT60) on one end and nothing on the other end (where does it go?)

I also have a 14MB 72-pin Actionsoft ST-RAM card and a Crucial PC133 128MB CL2 SDRAM/DIMM for the CT60, so I think I got the memory covered. My Falcon motherboard revision is G/E and has the Steinberg SCSI clock patch and audio mods installed by ATY Computer. My Falcon works fine otherwise without the CT60 plugged in.

I know many are enjoying their CT60ed Falcons now, but can anyone help a late comer? :)
Thanks!

4099. CT60 and NOVA

Newsgroup: comp.sys.atari.st
Date: 2004-07-14 10:40:27 UTC
From: falcon@roecks.com
Message-ID: <fdc8625.0407140240.41b24c51@posting.google.com>
Source record: 17893

Hi,

does anybody know about the status of CT60 and NOVA card?
I read that people were working with the source code to get it working
back in 2003.
Before I got my CT60, I used an AB040 with Nova card.
Now with my CT60 I REALLY miss the Nova card. I am even thinking about
putting the AB040 back into my falcon. :-(

What is the best way to get the nova adapter 'under' the CT60?
It seems that I would need a 3 cm connector. Where can I find
soemthing like this?

Thanks,
Wolfgang

Well that's not good. Stuff like this shouldn't happen with the "without
solders" installation. With solders and an overclocked bus things can be
different.

> I checked the CT60 web site, and it looks like my ABE/SDR chips are out of

Well, I have a JTAG cable that I could update your CT60 with. I'm in the
USA, Philadelphia. But I have to say, check to see what was fixed between
SDR5D and SDR5E because I had a perfectly working system with SDR5D. I
would definitely look somewhere else. Try tweaking settings inside
aniplayer config, also try falcamp. Try with and without dsp. This will
help Rodolphe or Didier narrow the problem.

> Actually, the easiest way that I found was in the latest MyAtari magazine
> article "CT60 Essentials" that mentions a cable built/sold by Andreas
> Pettersson. Does anyone if he still sells these and how to contact him?
>

I have one of these but I don't know if any more are for sale. Not really
worth buying for one or maybe two more updates ever. So far my JTAG has
updated 3 falcons (2 not mine) so I think it's more worthwhile to get one
and pass it around a particular country. Seems like you're in the US so
you can borrow mine. Just have to pay shipping.

> My CT60 also came with 3 things that I don't know what they are for:
> 1. a resistor (I guess for flashing the ABE/SDR without unplugging the CT60)

Nope, at least I don't think so. I think the resistor for updating that
hardware without unplugging is something you have to purchase on your
own.

> 2. what looks like 3 surface mount resistors marked "3360"

These are because a proper installation of the "with solders" involves completely removing your steinberg sdma patch. Once you remove this patch, you solder this resistors to the 3 spots near that clock patch.

3. a
ribbon
> cable with a 10-pin female head (which looks like it plugs into the
> 10-pin male port on the CT60) on one end and nothing on the other end
> (where does it go?)
>

Soldered to random points on your falcon's motherboard. Again, this is all for the bus overclock installation. This makes your stram transfer a little faster, dsp a little faster, video a little faster, etc. Worth it if you're crazy like me, otherwise leave well enough alone ;-)

> I also have a 14MB 72-pin Actionsoft ST-RAM card and a Crucial PC133

I wish to remove the case of a STacy I have been given.

I can get the case part way off, but it appears the cables from the
monitor hgold the two parts together.

I am guessing I need to remove the screen first, but how?

Does anyone have instructions on removing the case of a STacy?

You are correct about the screen it comes off easily enough when all connections are pulled. You have to pass all the cables thro the hollow centre of the spring loaded hinge assembly to get the top half of the stacy off. They just about go thro one at a time. I have done this loads of times, It just needs a methodical approach and care.
I have heard of people that have managed to change the HD without removing the top but that is like keyhole surgery and is very hard on the knuckles!

I believe its false economy to reuse crimped connectors, they aren't
expensive, best to buy new.

But apart from that point you are spot on.

OK I appear to be on track (finally).

The screws for the cover are hidden under the label

(/|\ Atari STacy)

(the label just below the monitor screen). I peeled off the label and
stuck it on the body where it won't be in the way next time.

Several of the plastic catches broke, so the lid won't ever again sit
together perfectly, but what the heck.

I haven't got further yet, but it all looks doable now, thanks.

Just a short note to let you know you can find heaps of music software
for Atari (mainly STs and Falcon) at http://www.hitsquad.com/smm/atari/?ng

Software is broken up into 22 categories including Midi Sequencers,
Midi Utilities, Multitrack Recording, Audio Editors, Format Converters
and much more.

I see no reason why not...
Just get appropriate bolts (lockwashers recommended to minimze potential for vibrations/buzzes) and yer in buissness. It's possible to introduce new rattles and noises...if you pick up a buzz, add rubber, teflon, or platic washers.

Brian

Hi,

I just got hold of a book called "Introducing Atari ST Machine Code"
by R. Pearson and S Hodgson, published by zzSoft (ISBN 1 873423 01 2)

It is supposed to be accompanied by a disk containing an assembler,
editor, some sample programs etc...

Does anybody out there have this disk? If so can I have it? Or a copy
or image file of it?

// Mikael

Hi Mark,

I tried all kinds of different settings (with/without DSP, DMA transfer on/off,

auto/force detect external clock, etc.) in Aniplayer, but still no sound. I also got FalcAmp and still no sound. Without the CT60 installed, everything works fine.

Crashes are pretty random about which files I play (MP3, MOV, MPG movies), and I play them from the 2.5 inch IDE drive (an 800MB Maxtor). It doesn't happen much I have to admit, but it's annoying. I miss my sound though! :-(

From your explanation, it looks like the extra doodads will go back into the parts drawer as I'm not a "solders" person (yet). :)

Thanks for the JTAG cable offer. If no one else has any suggestions for me, I'll send you email and then try flashing my ABE/SDR chips with it.

-Phil

>> Hi everyone,
>>
>> I've finally gotten around to installing my CT60 in my Falcon. (I got it

4120. IDE to ROM connector

Newsgroup: comp.sys.atari.st
Date: 2004-07-17 23:22:04 UTC
From: Atari-Korps <news@atari-korps.com>
Message-ID: <cdccas$pp3$1@sparta.btinternet.com>
Source record: 17819

Hi, can anyone tell me where I can find a '40P(PC IDE style) ribbon' to 'Atari ROM' connector?
I have one (made by Hybrid Arts), but I need another!!! is this a fairly common adoption? I tried to make one myself with an old 'forget me clock' cartridge and an old IDE ribbon, but failed!!

cheers

As far as I know:

it had a internal SCSI hard drive fitted instead of the IDE type commonly
installed on the regular Falcon.
It also had a different sound configuration...(not sure if it had a custom
chip fitted)..with extra audio sockets on the back..
sorry to be vague... i have only ever seen one and a long time ago....

hi!

I really don't understand your trouble??????

just go to:
http://www.atari.org

You wll see new eiffel producer:)
3 options possible:)

Very low price:)

Then just choice your keyboard and mouse anywhere:)
The compatibility with ps/2 and whell mouse is just perfect:)

And the cherry on the cake, the last option for compatibility
with multimï¿œdia keyboard too:)on didier mequignon website!

Bye:)

After fooling around a bit, I can maneuver the falcon mb onto the backplane without having to remove the backplane.

My question now is, I drilled a practice hole on the mainboard and tried to screw in a standoff but...I nearly had to force it in and the threads on the standoff got a bit mashed.

Is there a special way the holes for the standoffs need to be drilled?

Thanks

Hi all,

Anyone got the Floppyshop PD collection on CDs?

I've had a question from someone who has the set but has found that CDs 4
and 5 are both blanks.

Despite the info available,

I should have at least one good MSTe/TT keyboard that works. I have Mega
ST keyboards but they're all flaky.. Mystery mouse movements and that
sort of thing.

Thanks,
Mark

I drilled larger than the standoffs and then found the proper nuts for the
back of the standoff at home depot and bolted them in so that there was no
chance of them coming back out. If your standoffs have good depth you can
even throw a washer in there for good measure.

Thanks,
Mark

I agree with Steve after reading your posts over the last few months! You have said yourself that you are as "dumb as rock" so it seems you should get some one else to recase your Falcon or buy a Wizztronics Falcon Rack which are being cleared out at a $99 check there web site. None of us want to see this end up as the Falcon Tower Tragedy!

Be that as it may, I did have some people who were kind enough to explain a couple of details which I was not sure about. Since then, I pretty much know what I need to do, and also which specific questions to ask.

I am now ready to mount the mb into the case....I just need to get some standoffs, nuts and screws.....and I'll be set as far as the mb is concerned. Then I'll concentrate on the port extension, keyboard, etc.

So, because of the help of a few, and in spite of those who were, shall we say, non helpful, I am moving along in the right direction at a slow but steady pace.

Thanks,

For my HP692C (USA), transformer by Lucent:
Input is 120v AC shown by a sine wave instead of the letters AC
Output is 30v DC (linear) shown by a solid line over a dotted line
Plus is the outside of the plug
Don't know if there is a 240v version

Indeed it's practical. My setup is a falcon style to mega ste style keyboard adapter (home made, but they are selling them on ebay for $1.00 or so). Then I bought a very long 6 wire RJ-11 telephone cable from radio shack. Cut the wire right down the center, flip it on one side and resolder (not sure why the keyboard cable is like this, but if you DON'T do this you will fry the keyboard controller and kill the keyboard). And resolder everything then and tape it up. Then you can put your computer wherever you want and have a long cable. As far as the one I have, I have to first have the motivation to find it and test it. Then I can decide on a price based on condition. Some of them are discolored and have cigarette burns from their prior owner. What condition are you interested in?

Thanks,
Mark

Hi all,

I have a ROM-port ethernet kit for sale - everything you need to attach your Atari to an ethernet network - the disk has drivers for STinG and MiNT and it works very nicely with Magxnet.

The kit includes a Genius LAN parallel port to ethernet adaptor which can be powered from the ROM-port adaptor or from the included PSU.

It was working 100% when it was removed from my Falcon.

Any interest at 20UKP plus post - email replies only please, after taking anti-spam measures.

It sounds like you need to check the assignment of the objects on the mixer map. They need to be assigned to DSP. My falcon isn't set up right now, so if memory serves, double click on the object (pan, fader, whatever) and it opens up a page allowing the object to be assigned. You can do them all at once by selecting them all and making the change while holding shift (I think!) A little dialogue will pop up asking if you want to make that change to everything. Confirm and close, and you should be good to go!

Wayne

I'm not sure, I believe Keith Scroggins might have been selling them. I
think his ebay username is mouse_master but it might have some numbers
attached. Search for atari stuff and you'll surely find his eBay username
somewhere, then browse his auctions. He's got good stuff. There's a good
chance the auction is over and they haven't been relisted. If you find
his eBay user name, send him a message and ask him if has any.

Thanks,
Mark

It's the works part that's the problem. I have like 6 TT keyboards, all
with bad mylars. I need 2 of them or so for my 2 TT's as is. So I might
be able to find something, maybe not. Last night though I had to restore
my falcon from backup due to a little oops on my part. On the bright side
it proved that my backups are good!

If the cable is in need of being "flipped", this must be specific to
the adapter you use. The original keyboard cable is for sure *not*
flipped, so better be careful here!

IMO it would be a better idea to make the adapter work together with
the orignal cable instead of relying on a custom keyboard cable.

I agree. If they feel a need to switch who can stop them? For my Falcons I can repeat and repeat again that they are fast enough for me and thanks to Lyndon Amsdon who recently sent me an EtherNEC my two main Falcons now even exchange files on the fly.

All items below available for listed price plus USPS Priority shipping.
All items worked when last used, though none has been used recently; as
such, I make no guarantees as to functionality, and all sales are final.

Magic Sac Mac emulation package - $30
(includes cartridge w/ROMs, 5.91 software, Translator One,
cables, manuals, Epstart)

Magic Sac Mac emulation package - $30
(same as above but with 6.1 software, no Epstart)

Magic Sac Mac emulator cartridge - $20
(cartridge w/ROMs and manual ONLY)

Spectre GCR Mac emulation package - $30 (have two available)
(both include cartridge w/ROMs, cable, manuals, 3.0 software)

Payment accepted by money order or PayPal. Thanks!

- David

Message-ID: <slrncg9kg6.f8i.atari@komp7.euh-e.edu.pl>
Source record: 17713

Due to misplaced ST_RAM module I had puff of smoke from my Falcon.

Now, it bots, but:

When running NVdi - resets :(,
When starting AES - freezes :(

I saw that part marked as J22 on my falcons motherboard is completly melted.
Motherboard is Rev. D/C. J22 is placed near ST-RAM module and TOS ROM.

If anybody can check what exactly is J22, I could repair it.

Please, answer on the group, my mailbox unfortunetly seems down also :(

J22 is the fan connector. It, from the circuit diagram, at least once had
12 volts available. That does not explain other problems. Part number
C302883.

Look carefully for a blob of melted something behind the pins of nearby
chips. That might find your problem.

Have paperwork, do not have a Falcon.

Jim

ST-RAM is dammaged !
Did you try with an other ST-RAM card ???

The smoke your saw was from the ST-RAM !!
I'm 99% sure of that !

> I saw that part marked as J22 on my falcons motherboard is completly
> melted. Motherboard is Rev. D/C. J22 is placed near ST-RAM module and

Power for FAN ! Has nothing to do with your problem/ST-RAM misplacement !

Regards

I had a MK-X version for a while. The changes were an *optional*
internal SCSI port (mine still had the standard internal 2.5" IDE and
external SCSI-2), and modified audio. The modified audio was basically
the DIY modifications described in the Cubase Audio manual to make the
audio ports line-level instead of mic-level. I don't remember if the
MK-II also had this, but my MK-X had separated 1/4" left and right
ports (better for connecting to line-level instruments and mixers)
instead of the stereo 1/8" jacks the normal Falcon had. The MK-X also
had its desktop-style case with the optional M-STe/TT keyboard, or
PC-compatible keyboard, and lots more room than the standard Falcon
case (although I never figured out how to get a CD-ROM drive to fit,
even though they claimed it could - drive bay space not quite tall
enough).

the subject of Discovery Cartridge.
>Can anyone give me the going price on a good used Discovery Cartridge with
>cable and disk?
>
>

Hi

I suppose it depends which version of the cartridge it is. And if it's
the full version what options has it got.

I paid $100 plus shipping for an option 0 (full version not the mini)
not so long ago as a back up.

I use an option 2 which came with apple rom's onboard, hi and lo memory
switch, clock (although the Mega STE doesnt need it), pass through for
cartridges, options for an extra 2 floppy drives - as i've got a dual
3.5 and 5.25 drive unit connected along with a SF314 (for it's pass thru
port) and it also has the ability to switch the drives around via a
switch.

These carts are very useful hardware and not just for creating
guarenteed identical disk backups. Use can also back up the disk as a
file, even heavily protected ones, send it via email or stick on cd-rom
for recreation at it's destination via another happy cartridge.

Hi Derryck Sorry for the slow reply. I have the CD's you are asking
about.
However, when I tried reading No 1 recently, I had no luck
(even on this PC) until I tried an external Plextor drive on the Atari
(MSTE) I'll be backing them all up very soon!!!
I think the problem with my set is that they are on CDR's
which are not readable by all drives. That might be your friends problem.
Let me know if I can be of any further help.

Regards Mark.

Hi,

I have wrote a little plugin based image viewer because no one works for
me on Aranym.

Of course, it's work on other system but you need a 68020 (or better),
a FPU and a VDI with EDDI (like NVDI 2.5+, NovaVDI, fVDI, etc).

I hope that it will be usefull:

Nice piece of software!
I have two little suggestion for zView:

1. use DSP chip on falcon for decompress jpeg files
2. Displays EXIF picture infos in "Information" dialog.

Ciao, Bernd

You were right!

After carefull check, I found that only ST-RAM card is burned (but SIMM
module seems ok). So I puted in my old 4MB card, and everything rocks
again. :)

Thanks for everyone and especially for Mark Friedman. :)

Will you email me privately?

As a club project we're assembling a complete set from the bits and pieces
of working disks.

> (even on this PC) until I tried an external Plextor drive on the Atari

I wouldn't have thought that the problem would be with the actual disks (ie
CDR) as the person with the original problem could read some but not all.
We'll see.

Thanks for the reply.

Of course.

But it's 48x48 icon and fVDI has some problems with icons greater that
32x32... So I hope for you that you own NVDI.

It's here:

I don't know if today, decompressing a JPG with the DSP is a good thing.

All the Falcon's users that I know owns a accelerator like the CT60 or a Afterburner and reading a JPG is, in any case, faster with a 060 that with the old Falcon's DSP.

Of course, it remains some stock falcon around (10? 15?) so, I will make this DSP plugin but it's not a priority for me.

> 2. Displays EXIF picture infos in "Information" dialog.

The JPG plugins can read already the EXIF data but, "zview light" doesn't care about it.

Don't forget, the application's name is "zview light edition" and not 'zview' :)

In case anyone is wondering those are (mostly it looks like) gnome icons, as they are gnu gpl or some similar license (maybe creative commons), they can be published anywhere.. Might I suggest an addition to Teradesk/Freemint. Of course if Zorro has additions, we'd need his permission.

You should give MiNT a try.

http://sparemint.atariforge.net/sparemint/

Sparemint is a MiNT-distribution, based on RPMs. This is the package-list:
http://sparemint.atariforge.net/sparemint/html/packages.html
A ssh-client is also available, but I doubt it will work with a 2MB
machine(maybe with 4MB?). Beside that ssh is terribly slow on original
Atari-machine. You can take a nap, when you are logging in with ssh...

I don´t know of any other ssh-client, but this one(openSSH).

Regards,
Matthias

4192. [UTD] August Release of Eureka

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". It is updated
nearly every month, if I found significant improvements for it.
You will have to fetch it at :

http://eureka.atari.org/eurka408.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

There have been improvements done in the generation of
metafiles (*.GEM) with SpeedoGDOS or NVDI. Bug tracking
and optimizations. Those modifications are mostly
inspired by the apparition of MyAeS (http://myaes.free.fr).

I wish you big fun with all this new STuff !

Best regards,

Hello, Matthias.

I remember running a very early version of MiNT on my STFm (which had
3MB of memory ;-)), so I know a version of MiNT existed that ran on an
original ST.

Maybe I will be able to run a crippled SpareMiNT installation, enabling
me to use some nice features (like filesharing through samba), but I
think the 2 MB boundary will restrict me a *lot*. However, I can not do
much about that, can I? Is there a *simple* way to expand my MegaSTe to
4 MB or even higher? Then I would try that as well.

I know OpenSSH from my Linux machines as well as my MacOSX machine. The
version you linked to is compiled with the 68020 as a target CPU, so at
least I will have to recompile it after installing SpareMiNT.

Well, at least this will not be a very easy exercise, that's for
sure....my God, a lot has changed since I pulled the plug on my ST's....

Sure, the handshake procedure of SSH takes some CPU time, but once
logged in I have good hopes the Atari can keep up with

encrypting/decryping the traffic....?

Regards,

Rene.

Yeah. Once upon a time. The current desires of a unix system require a
little bit more ram though. In your case you're looking at Freemint,
straight to an AES with networking. That's it. And even then you'll have
(slightly) less free ram available than after booting up a well configured
MagiC installation. MagiC is cream of the crop on ST/STe machines, that's
for sure.

>

It's absurdly simple. Unlike some of the older Atari's, the Mega STe has 4 SIMM slots. Just go out to your computer store (preferably one that deals in old used parts) and find 4 30 pin simms. eBay is a great place to find these 2. You're looking at about $1 for 4 megs... Seriously. They click into the slots on the board - very intuitive.

And it's done that way because it needs an fpu. This is not to say that with some effort and some wizardry you couldn't get it compiled with libm and fpu emulation.

> Well, at least this will not be a very easy exercise, that's for
> sure....my God, a lot has changed since I pulled the plug on my ST's....

Oh yeah. Unfortunately an ST is a play machine anymore, unless you have MagiC on it. Even then it's only moderately functional on today's internet - A falcon with a CT60 however is a pretty strong animal. I have ftp, sftp, ssh (client and server), irc, a great web browser (http://highwire.atari-users.net), and due to our fantastic kernel maintainers, freemint is solid and has very predictable behavior.

>
> Sure, the handshake procedure of SSH takes some CPU time, but once
> logged in I have good hopes the Atari can keep up with
> encrypting/decryping the traffic....?

Well, my falcon, even with just the 68030 @ 16 mhz could do ssh no prob. The problem is the timeout during hte initial handshake. An Ste would have a bigger time dealing with this. A TT can also do ssh well. Once they are connected, via toswin2 it's just like using an xterm under a brand new linux box, but getting that ssh connection is slow. With a CT60 even there's still a lot of noticeable lag in getting the connection compared to my 1.2ghz athlon.... encryption must be tough on a cpu ;-)

Also keep in mind, each openssh process requires something like 1.5 megs or more of ram. An ST, even with 4mb this could be impossible. best to telnet to another machine on the network and ssh from there - it's tough to accept a machine's limitations.

There exists boards to upgrade a mega ste to 8 megs or more, but I have been unable to procure one of these and I'm really good at finding that type of thing :-(I wish there was more out there, like the Marpet boards for normal St's.

Thanks,
Mark

The Discovery Cartridge plus side: It gives you a lot of control and features.

Minus side: You have to know what your doing. It's complicated.

I prefer a Synchro Express or a Turbo Blitz Cable. Someone could build their own Blitz Cable. Synchro Express was commercial. I love my Synchro Express. Bad side: Copying software needs 2 Drives and should have matching drive Mechs. Not as hard as it sounds. Just match the Drives eject buttons. I don't know if the Turbo Blitz needs matching drive mechs. It would be nice if someone still built the Turbo Blitz Cables. I think the Copying Software is free.

These Cables (Both Blitz & Synchro) Dumb Down your floppies so they can copy and still not know errors. Also, the Discovery Cart needs you to tell it if the Floppy your copying is single or double sided. This is important to sucessful copying. On the other hand, both Synchro & Blitz can determine that themselves. Thanx! ===Ben===

I'm sure you won't like to run ssh without FPU support. It require 3-4
minutes to establish a ssh connection on an ATARI TT. It will take ages
without FPU on an 8 MHz ATARI ST.

Regards,
Frank

All items below available for listed price (US dollars) plus USPS
Priority shipping. All items worked when last used, though none has
been used recently; as such, I make no guarantees as to functionality,
and all sales are final.

Magic Sac Mac emulation package - $20
(includes cartridge w/ROMs, 5.91 software, Translator One,
cables, manuals, Epstart)

Magic Sac Mac emulation package - $20
(same as above but with 6.1 software, no Epstart)

Magic Sac Mac emulator cartridge - $10
(cartridge w/ROMs and manual ONLY)

Spectre GCR Mac emulation package - $20 (have two available)
(both include cartridge w/ROMs, cable, manuals, 3.0 software)

Payment accepted by money order or PayPal. Thanks!

It's useful indeed. At least a picture viewer which doesn't crash on
long file names.

One problem: Interlaced GIF's are't displayed correct.

That's on a Hades 060 running freeMiNT 1.15.12/N_AES 2, novaVDI/NVDI
5.03

That only applies to SSHv2 - v1-connections (ssh -1) are quite a
lot faster, but unfortunately also not fully secure due to some
flaws in the protocol. Of course, it's still better than using
telnet / rsh ...

Ciao

> (although it has a keyboard with some problems.

Hello, all (again) :-)

First, thanks for all the positive responses to my original SSH question. The original questions has led to some spin-off now.

I opened the case and (hey, I was used to an 1040 STf!!) I was surprised by the components and modularity of this Mega STE compared to what I was used to on the 1040 back in 1986. And it is 'old-pink' inside :-)

First: it seems to have a quite standard FDD, although this one has a DD drive (720K). Is it possible to replace it with an ordinary 1.44 floppy drive from an ordinary PC? I have one here for spare parts....does anyone know if this can be done easily?

Second: the same for the HD. It is a 48MB HDD and it looks like we have an adapter built-in? Is this an ordinary SCSI drive Atari built in? If this is the case, my hands are itching to replace it with some multi-100MB SCSI drive of more recent build.....can this be done?

Third: The memory (as already told) is in 2 SIMMs. However, the SIMMs yield no specs to me. Can someone tell me what SIMMs I exactly need to make this a 4MB machine from the 2MB already there?

Fourth: There is a slot for a 68881 or 68882 FPU. Which should I use? Would it make any difference (for example in our SSH case...)?

Fifth: The OS: Is a MegaSTE with 4MB OK for the hailed MagiC? Or FreeMiNT? I have read about these on the net, but can someone please tell me about which one to use in what case?

Sixth: heeee, maybe (after 18 years!!) I am still a geek for wanting to get this machine on its feet again :-)

It's summer now, guys. But this looks like a nice project for any season :-)))

Your help and contributions are very much appreciated. I used to be a very experienced user of my STF back in 86 (until about '92), but it seems I have to catch up after all these years. Mac OSX and Linux give me a lot of computing fun, but the roots are still back there....

Regards

Reni¿½ Kint

Yes and no. Theres two versions of MegaSTe around. The early one has an
older style AJAX floppy controller and it is not compatible with 1.44mb,
plus there is a GAL chip that needs replacing on the board. Later versions
have the right AJAX chip AND GAL, and just need the 1.44mb mechanism.
Getting hold of a new AJAX and GAL isnt that hard, its just EXPENSIVE! You
can always do an 'STfm' style mod, which invloves overclocking the AJAX to
get the higher track density. Have a snoop around on Best Electronics at the
part numbers for the AJAX and GAL and compare to what you have inside your
case.

The MegaSTe SCSI card is rather weak. You can put a _single_ SCSI drive on
there upto _1GB_ physical size, and nothing bigger. The card does not
support Parity either, but this can be added by yourself with a little
know-how and a few parts. I have heard that some people managed to put 2
drives on that card. I wouldnt try it unless you have a spare SCSI card and
don't mind blowing one of them. Also, you must keep the SCSI cable as short
as possible.

> Third: The memory (as already told) is in 2 SIMMs. However, the SIMMs
> yield no specs to me. Can someone tell me what SIMMs I exactly need to
> make this a 4MB machine from the 2MB already there?

Standard 1MB-80ns and better. 8/9 or 2/3 chip, makes no difference. Better off buying a matching pair of 4 off evilbay or something.

> Fourth: There is a slot for a 68881 or 68882 FPU. Which should I use?
> Would it make any difference (for example in our SSH case...)?

Not sure. I know the '82 is much faster for a given clock speed and is a drop in replacement electronically for the '81 but the instruction set is not _exactly_ the same on each chip. It could be that you will have one piece of ST software that runs great on the 16mhz STE, but produces floating math errors or crashes because it expects an '81 and uses that instruction set. No harm in trying the '82 though, but bear in mind that those PLCC sockets are fragile, and careless plugging or unplugging will break it.

> Fifth: The OS: Is a MegaSTE with 4MB OK for the hailed MagiC? Or
> FreeMiNT? I have read about these on the net, but can someone please
> tell me about which one to use in what case?

Don't know. On my 16mhz Falcon I wouldnt really want to use either as a TOS replacement, too darn slow. Now I have a CT60 I don't care ;-) (except I don't run that MagiC crap). I have not tried running either on my MegaSTe, I am happy with TOS 2.06 as I mostly use it for Music and playing ST games.

> Sixth: heeee, maybe (after 18 years!!) I am still a geek for wanting to
> get this machine on its feet again :-)

Can't blame you. Most of us that are here at one time left the Atari scene for one reason or another and came back from useless empty computer experiences longing for the love that we had for ATARI. :P

Well, I have run around internet a LOT tonight, but I can not find any
info on WHERE TO LOOK for this AJAX and GAL in my MegaSTE. Do you have
a pointer to this kind of info? I found a parts list but it doesn't
tell me where on the system board the parts are located ;-)

Well, Coda, I would say that 1GB is quite a lot of room for my STE.
Remembering what I could do with my SH205 back then...and that was 20MB!

I think I will stick to one drive, and maybe try to find some external
SCSI-ACSI host adapter on the net later. Must a drive be SCSI-1 or can
it also be SCSI-2?

Finding this is harder than I thought. Not found yet.

> set. No harm in trying the '82 though, but bear in mind that those PLCC

I will try to find a 68882 and drop it in.

Hmm, this is not an OS war, is it ;-) I am too old for those ;-)!!!!

I am quite Linux-minded, so I might try something like FreeMiNT, don't
know about Magic. TOS 2.06 is on board, so there is always SOMETHING to
run.

>
>> Sixth: heeee, maybe (after 18 years!!) I am still a geek for wanting to

That was the exact phrase I was trying to find! "Empty computer
experiences". On the PC, I felt degraded to being a user, not really
using the machine as a hobby project on itself anymore. Atari was a
computing experience, I was a user, but also did a lot of
experimenting, both in software as in hardware. Once the PC came
rolling in that was all gone....Linux revived this (and so did OS/2 for
me, but maybe later on that :-), and the Apple machines still have this
user/experiment mix to me, especially the older models. I type this on
an iMac which is a very nice office machine and it is Unix! So still
room to experiment, although not on a hardware level (my girlfriend
will kill me ;-))

>> seems I have to catch up after all these years. Mac OSX and Linux give
>> me a lot of computing fun, but the roots are still back there....
>
> I think thats where I went wrong, I didn't go with mac, but with PC. But
> hey, maybe thats what brought me back here sooner than you! :)

Hey, you're forgiven :-)

I went PC (but OS/2, not Windows), then Linux, recently added Mac; and
now I have the Atari and my old C-64 and VIC-20 machines in sight
again......I must be getting old and nostalgic. But you got it right,
it is about filling the gap of empty PC experiences...!

Regards,

Renï¿½

Get the MegaSTe squeematics from vezz's site:
http://atari4ever.free.fr/hardware/docs.html
(I just checked the site, the diagrams are 404 at the moment, I will try and dig them out).
On best electronics, the HD Ajax is listed as: C302096 or C302434 check these against the Ajax in your box. It may say WD1772 on it somewhere, and I think its a 28pin chip. The PAL/GAL for the HD drive part number is C301901-002. Its probably a 20pin IC though I can't remember.

> Well, Coda, I would say that 1GB is quite a lot of room for my STE.
> Remembering what I could do with my SH205 back then...and that was 20MB!

Indeed.

> I think I will stick to one drive, and maybe try to find some external
> SCSI-ACSI host adapter on the net later. Must a drive be SCSI-1 or can
> it also be SCSI-2?

SCSI-2. I don't ever remember seeing SCSI-1 drives.

> > Standard 1MB-80ns and better. 8/9 or 2/3 chip, makes no difference.
Better
> > off buying a matching pair of 4 off evilbay or something.
>
> Finding this is harder than I thought. Not found yet.

Some will turn up soon. Maybe someone here has a set they can donate ;-)

> I will try to find a 68882 and drop it in.

PLCC version only. Don't buy the PGA version. Dont waste money getting a quick one (say 33mhz) the 16/25 fpu will easily overclock to 33/50mhz. How you do this in a MegaSTe I havent explored yet (My falcon's 25mhz 68882 runs at 66mhz very nicely).

>
> Hmm, this is not an OS war, is it ;-) I am too old for those ;-)!!!!

No, I just never stated my opinion before on the matter so I thought I would this time seeing as I had the chance. Mint is still being worked on. Magic is not. Therefore Magic is dead.

> I am quite Linux-minded, so I might try something like FreeMiNT, don't
> know about Magic. TOS 2.06 is on board, so there is always SOMETHING to
> run.

I am a Unix man myself. It's the only thing that has kept me sane the last
10 years. Lovely powerful shell, hmm shellscript.... :P I have had a linux
OS running on one of my PC's since kernel 0.99 but I still get fed up with
Linux occasionally. Thats why I put FreeMint on my Falcon, seeing as I am a
unix guru anyway :P but to be honest, I don't really have much of a use for
it on the Falc (at the moment), I just want a fast stable GUI, so I can get
on with my programming.

> That was the exact phrase I was trying to find! "Empty computer

> room to experiment, although not on a hardware level (my girlfriend
> will kill me ;-))

Yes a lot of us were suckered into the PC thing when 386's came out and
EGA/VGA graphics cards were available. After having only so many clock
cycles on our 8mhz 68K machines, then suddenly the world of bouncing
polyhedrons with funky music and flying thru tunnels, well when I first saw
that I was hooked on the PC format. Spent my first years Uni grant money on
386sx25 parts to build into a machine. I remember then we still had hope.
Hmm what was it that killed it? Oh yes. Windows version 3. Why didn't GEM
become the Windows of today?
Hey I forgot I do have a 68040 based Mac LC in my storage facility. I may
get it out and play with it soon, and see what I missed...

> Hey, you're forgiven :-)

Thanks, I needed that.

> I went PC (but OS/2, not Windows), then Linux, recently added Mac; and

I tried OS/2 and didnt like it. Can't remember why. I've been toying with
the idea of buying a Powermac at some point, but someone will have to
explain the deal to me about the mouse with only 1 button... (I DONT GET IT
APPLE).

> now I have the Atari and my old C-64 and VIC-20 machines in sight
> again......I must be getting old and nostalgic. But you got it right,
> it is about filling the gap of empty PC experiences...!

Now I would love to see a VIC-20 again, and the Dragon32. These (apart from
the ZX81 and Spectrum of which I own several :) were the first home
computers I ever saw with my own eyes.

Coda.

Yop bud,

Keep an eye for Crazy Dots cards preferably CDII (24bit) or at least
CD1 with 16 bit add-on module. Not the fastest card but very
compatible. Fairly common too.

Novas are fast but require external box for the ISA card (VME part is
the VME->ISA adaptor)... no personal experience but I hear they're ok.

You can drive both cards with NVDI5 which is better and newer than the
card's own original drivers.

Then again, you prolly knew all this and I just wasted my time ;) Talk
to ya lata dood.

Joshua.

4218. CTLink Project

Newsgroup: comp.sys.atari.st
Date: 2004-08-03 13:57:41 UTC
From: Rodolphe Czuba <rod-yenamarreduspam-olphe.czuba@free.fr>
Message-ID: <410f9c15$0$29418$626a14ce@news.free.fr>
Source record: 17764

www.czuba-tech.com

CTLink will be finished if at least 100 orders arrive.
For Falcon 030, the schematics are finished and the routing stills to be done.
Same for the VME version for MSTE, TT & Hades.

This project was started in April 04 and Nature informed me that they finished an Ethernet board for CT60.
Now they have added the same USB controller than on CTLink, and CTLink is using the same Ethernet controller than the EtherNAT board.
This will gain time for drivers for the two boards : Ethernet is managed by Nature and USB by Jan Thomas

Now you have the ball !
Let me know if you may buy this product ....
The more you will be, the faster will be finished the project...
I will record you up to september (beacause of your hollidays).

Thanks to all people that support the atari projects.

Regards

Just a hint, good or bad, depends how bad u want better GFX:

I sold AlberTT GFX card and got Riebl Ethernet card instead and run TT in
mono res. U got no colours, big resolutions and LAN access.. Bad point is,
they are prolly as hard to get as GFX cards, or even harder.

Janez

Nova's are pretty much awesome. I have one with the Mach64 graphics
chipset and it's fast. I can play quicktime video in truecolor on the TT
without a problem.

> You can drive both cards with NVDI5 which is better and newer than the
> card's own original drivers.

Indeed NVDI drives this card natively.

I have an AlberTT card I could probably sell but they're a strange card.
The video isn't quite right and has a bit of ghosting and they're awfully
slow for vdi scrolling. But it is 1024x768x16 cols.

Thanks,
Mark

In some respects you are. There's a coldfire project underway that looks
VERY promising. We'll have 300MHz or so Atari's. Another effort is
called Aranym which runs Atari stuff very very fast on PC hardware, that's
very mature and runs great. I use it to do atari development at work.
And lastly if you have a Falcon, the CT60 is a great upgrade. I don't
know if one can still be purchased from czuba-tech. Aside from that,
Milan and Hades are dead ducks - but still work great say their owners.

Thanks,
Mark

Hello, Rudolphe.

While gathering information, a number of questions still stay
unanswered (for me :-)

I have a MegaSTE2 so I would need the VME bus version.

- Is it USB and Ethernet? The schematic suggests this, but your text
makes me doubt...
- Will the drivers work on a MegaSTE as well?
- Will it support external disk drives? Now THAT would be great!
- Are there drivers for STiNG? Which platforms are supported?
- Will there still be room for another VME extension (for example, a
graphics card)..?

Maybe I have more questions....later ;-)

A tip for all other die-hards out there: I have been trying to dig into
all the possibilities of the Atari machines of today, but all info
about newer projects somehow assume you have a lot of knowledge about
the running projects. I left the Atari world more than 10 years ago; it
is hard to come back if the information is so short and incomplete, and
scattered around the net so much. For example, the Nature pages tell me
NOTHING about this project; the Czuba pages give me a layout and not
much more (see above questions).

Is there a page somwhere that simply tells me what is possible with
what hardware and software with my machine?

I am VERY interested in my 'new' Atari hobby. It is a hobby, I am in
it for the geek factor mainly, but I am very serious about diving into
it. But still it is hard to get up to date...

High regards, I think you re doing a great job.

Yes. USB provided by ISP1160, Ethernet provided by SMSC LAN91C111. Forgive Rodolphes text, as English is not his first language.

> - Will the drivers work on a MegaSTE as well?

Yes. Eventually. I have Falcon, TT and MegaSTe's so you can be assured that drivers will be thoroughly tested on each platform.

> - Will it support external disk drives? Now THAT would be great!

The USB support will grow depending on driver demand, my free time, and whoever else joins that wants to help out with the coding. Initially drivers will be Keyboard and Mouse only, and whatever is felt is highest priority after that.

> - Are there drivers for STiNG? Which platforms are supported?

I guess there will be, but you will have to direct Ethernet questions at the Nature project people.

Ethernet project page is here at Nature's website http://nature.atari.org/
USB project page is at http://www.janthomas.f2s.com/

I agree fully on that choice.

I don't know yet how to write device drivers, but once I got everythng
running I might fire up Pure C and dust off my old C programming
knowledge (if C is OK for writing device drivers, that is ;-)) and give
it a shot. Problem is I wouldn't know where to start. But that's for
later.

Do you have any idea how many people in the world are actually building
and writing hard/software for our Atari's? I have seen some stuff about
the Coldfire project, and I certainly would like to donate some time
(and later even money maybe ;-)) to such a thing, although I got the
feeling the number of real experts out there is quite low.....I might
feel like a fool compared to them :-)

I already ordered Elmar Hilgart's ACSI Ethernet II adapter, but at
least this way I sponsor development my way :-) So in october or so I

might get the money to buy this VME card. I like the idea of USB keyboard and mouse, and if it would extend to USB disks, mmmm. That would solve a lot of storage problems.

I'll keep on dreaming. My MegaSTE is still under construction.

Regards,

Renï¿½

4227. MegaSTE: HD floppy.....

Newsgroup: comp.sys.atari.st
Date: 2004-08-03 20:08:09 UTC
From: Rene Kint <none@none.given>
Message-ID: <410ff0a8$0$4738$e4fe514c@dreader18.news.xs4all.nl>
Source record: 17772

Hello.

As long as I am the only one in the world in need of hardware answers I keep on posting and I hope you all lurking will keep the answers coming ;-)

I have checked the internals of my MegaSTE (which has a 720KB floppy drive). It has the C302096-001A AJAX chip fitted under the SCSI adapter, and the GAL is the C3019301-002, right beneath the power supply.

The AJAX chip is good. But the GAL chip I don't know. Is it the right one?

Now: how to move on? Can I just plug in a HD floppy drive? I guess not: on the net I read about 'detect pin' problems and even one note about having to plug the drive upside down (so the cable will have to be cut because the plug doesn't allow for upside-down fitting of course). But others say they have been succesful.

Regards

Renï¿½.

C is a great language for doing almost anything. The only problem is that it is not as good for device drivers when you have a specific number of clock cycles to play with. C compilers vary greatly about how they optimise code. I will be working from the Philips devkit sources mainly which are written in C++, but I will definately write the hardware driver in ASM, and as much of the USB stack as I can, but it is likely that the Class Drivers (Keyboard/Mouse/Storage/Printer etc) will be written in C for easier development and integration with the OS.

> Do you have any idea how many people in the world are actually building

No, not many I guess.

> the Coldfire project, and I certainly would like to donate some time
> (and later even money maybe ;-)) to such a thing, although I got the

I confess I havent been involved with the coldfire scene, I thought the project had been cancelled, though I may be wrong (I hope so).

> feeling the number of real experts out there is quite low.....I might
> feel like a fool compared to them :-)

No way. Everyone has to start somewhere and if a rank amateur can write USB drivers (we shall see ;) then everyone has a chance of accomplishing something for the Atari community.

> I already ordered Elmar Hilgart's ACSI Ethernet II adapter, but at

>
> The AJAX chip is good. But the GAL chip I don't know. Is it the right one?

Cut from my other post:

"On best electronics, the HD Ajax is listed as: C302096 or C302434 check
these against the Ajax in your box. It may say WD1772 on it somewhere, and I
think its a 28pin chip. The PAL/GAL for the HD drive part number is
C301901-002. Its probably a 20pin IC though I can't remember"

Are you sure that your GAL is "C3019301-002" maybe the 3 is a mistake? I
thought all Atari part numbers were C and 6 digits...???

> Now: how to move on? Can I just plug in a HD floppy drive? I guess not:

If the Ajax and G/PAL are correct then you can just plug in an ATARI drive.
If you are wanting to try a PC drive, then there are considerations to be
made.

PC drives are set to drive 1 (B) instead of 0 (A). You will notice that all
PC floppy cables have a twist in them. On the Atari there is no twist. This
is normal. The PC is the freak (what we have all been saying all along). In
order to use a PC floppy on the Atari platform you must change the drive
back to "Drive Select 0". Not many FDD's have the DS jumpers on anymore, but
there are quite a few of them that have little solder pads instead. Note
that a lot DO NOT have these pads now (I checked the offering in PC World
the other day, and theirs did not have the jumpers or solder pads
accessible). What you need to do is desolder the DS1 solder bridge and
remake it on DS0.

> on the net I read about 'detect pin' problems and even one note about
> having to plug the drive upside down (so the cable will have to be cut
> because the plug doesn't allow for upside-down fitting of course). But
> others say they have been succesful.

Some people report problems, some don't. I put a newish FDD in my Falcon last year and I have had no problems whatsoever. It is possible to still get Atari HD FDD's but because of the rarity you will likely get ripped off.

The other thing to think about is the shape of the Bezel on the FDD. Standard square PC drives may necessitate you modifying your case...

Coda.

I follow you. Drivers are timing-sensitive, and most C code can not
cope with this. Maybe with some inline stuff :-) But I guess you are
right here (again :-)

acp.atari.org has been updated: MiNT seems to be running and there is
I/O so I hope they will be able to run some more real soon now (tm).

This is a project that would definitely have my support. I saw Elmar
Hilgart c.s. is involved, but the news is leaking very slowly....maybe
one or more of them are reading here? Hello!!!???

> cordless USB keyboard/mouse package :-)

My keyboard is broken and the mouse is crap after all these years. I'm
surely into being able to use newer USB stuff for I/O. Like a SVGA/DVI
adapter for my monitor; this SM144 will be a problem some day.

Yep you are right. Typo.

> PC drives are set to drive 1 (B) instead of 0 (A). You will notice that all

My first reaction woud be: so what? I could access the drive by
clicking on the icon of drive B:...or is there another problem
preventing this to work without modifications?
>

I have a number of older drives in my studio, and will check them for
jumpers or solder pads.

I am not going to take that risk. Maybe if I ever run into one. But I
guess that noone sells spare parts, only complete machines.

> The other thing to think about is the shape of the Bezel on the FDD.
> Standard square PC drives may necessitate you modifying your case...

Yes I already noticed that. But to be honest, I wont be using the
floppy much as soon as I got my machine running with a network and
ftp/drive sharing access. All real storage and file exchanging is
planned to be done over my network straight to the RAID-1 Linux server
in the basement I built with about 80 Euro's cash (yes I love running
Linux). Maybe just to KNOW it works could be enough, so whenever I get
into an emergency/non-boot/HD-less situation I can always revert to
some floppy with drivers, etc. Even if it requires me to open the case.
I did the same with my server. I used a CD-ROM from another machine to

install Linux on it. Now it has no floppy, CDROM or other removable storage whatsoever. Until it breaks or has to be reinstalled.

I have a TT030 and replaced my 720k drive recently with a Epson SMD-300
(340) 1.44m drive, which is a direct drop in replacement, I set it to DS0
and all was good. Works perferctly, no problems at all. I believe the
MegaSTE is the same as the TT.

Hello!

> C is a great language for doing almost anything. The only problem is that it
> is not as good for device drivers when you have a specific number of clock
> cycles to play with.

You are wrong here. C is also designed to write device drivers. Timing
critical things are a question of the algorithm, not the language you use.
E.g. if you have to wait 0.5 milliseconds it don't matter if you code this
in C or asm. C is just much better to handle and easier to adapt and
integrate. The FreeMiNT device driver framework include for example
precise timing routines. Btw. I hope you are interested to support
FreeMiNT as OS too.

> C compilers vary greatly about how they optimise code.
> I will be working from the Philips devkit sources mainly which are written

> of the USB stack as I can,

That's bad to hear as this will limit the useability and portability. Not
to speak of the maintenance that is much harder for asm :-)

Regards,
Frank

Does FreeMiNT run usable on a plain MegaSTE with 2 or 4MB? This is a
16MHz machine, mind you ;-) And how about a 8 MHz ST/STE?

I remember running very early MiNT versions (from Eric Smith directly
back then), and they were slow, especially when UI stuff was involved
(it was very difficult to run a GUI application at all back then as AES
(is that the correct one..?) was not multitasking..

Is this Epson a common model? Or will I have to shop around much for used ones?

I have a Samsung here that I took out of an old PC, it has solder pads
for DS0 and DS1, so I will have to heat up the iron after more than 10
years again and start poking!

I tried it as DS1 but the MegaSTE did not respond to it at all. Not
even as drive B :-)

Moving slowly, but steadily...

Renï¿½.

PS: Do you mean that as a drop-in replacement you didn't even have to
change the bezel?

No it wont work. I tried a long time ago, using the DS1 jumper as is, and
using a PC's twisted cable. You will get varying errors from no disk in
drive, to data corruption. Try it though if youve got spare time, and you
will see what I mean.

There are a few people that claim to have new or "refurb" Atari spec drives.
I believe Keychange is one of them.

You sound like my long lost brother. I did this too with my linux box.
Needed the Floppy, CD drive and the monitor for something else so I just
took them while leaving the machine running. I figured that as its up 24/7
and I don't ever reboot it, I can just do what I need to do remotely.

Coda.

No, im not talking about timing issues, im talking about CPU cycles IE how
much processor time you have. This isnt much of an issue on a CT60 equipped
falcon, but will be very important on a 16mhz 16bit 030, and more so on a
16mhz 68000. C adds varying amounts of extra baggage to code that otherwise
should be as small and as fast as possible.

Yes Freemint drivers are definately on the cards. I will be contacting the
Freemint team soon to discuss it.

> > C compilers vary greatly about how they optimise code.

The hardware driver is just the interface to the card itself not the whole
package like an XDD driver. This has to be small and tight. The USB stack
also needs to be quick, and whatever I can implement in ASM I will. The
framework of it may end up being C, but you will more than likely see a lot
of linked ASM modules, or inline 68K code. Maintenance is only significantly
harder with undocumented poorly structured ASM.
Portability to what? its not an issue as the package will be written to
cover all Atari platforms running a 680x0 CPU.

Coda.

Yes. Altough RAM may be an issue here.. If u use 1.14 kernel, naes and thing desktop in mono res, it gives u about 2mb of free ram (i have that on MST4). However, i dont know if new device drivers can work with 1.14., or if they can be force to work....

New kernels are more memory hungry....

I have done some real time programming, not much, but some.

In the project I worked on, there was one short routine that read the clock, and read lists of routines. Every 10 ms, it ran all the programs on the 10 ms list. The same for 20 ms, 50 ms, 100 ms, up to two seconds. It has been about four years since I did this, and so I forget if 1 ms was one of the rates available. This was all done in C, on a Seimens chip.

At least this is the way automotive people do things. It may work on less complex systems.

Jim

OK, so it's time to ask Frank, who is here somewhere :-)

Sad to hear the newer kernels are memory hungry, that would mean the
original machines would become obsolete in the long run....maybe Frank
can comment on his ideas about the future of the kernel.

Well maybe term "memory hungry" is not proper one.. New kernels don't just eat more RAM, they also introduce new things... I know older systems like ST, with 4mb only, will be/are unable to run newer kernels, but its sadly price of progress. Even so, MiNT requirements are pretty small.. U can still use Magic for example, it perform great on lowspecs machines and with MagicNET some of MiNT/Unix drivers should run i guess?

I use the exact same ne2k driver under MiNT and MagiC through MagiCNet.
MagiCNet is truly great.

Thanks,
Mark

Yes you do not need to change the case! Fits perfectly!!! All I have to do
is swap the plastic face and eject button, and it fit perfectly.

These drives are fairly common in late 90's PCs here in the USA. I actually
have a spare. It is actually the EXACT same drive that the Falcon030 uses.
Face and everything. But for the TT/MegaSTE the face needs to be swapped
from your 720k drive.

There is only ONE VME slot...soure we can do an adaptor that will bring the
2 boards out of the MSTE ...
Not nice...

> I thought that it was a VME-BUS, and in university I was tought that a
> bus can be coupled / chained...

Yes, it is a physical problem...
Not electrical...

If I design a PCB that measures 160*100 mm (VME) + 160*100 out of the MSTE
with CTLink features on it and a connector to allow to plug a n other VME
card on the second VME connectors this expansion...this will be like a
monster and it will cost more because of the PCB area...
No really good solution....

It runs (you will really need 4MB in order to run it) but is not really usable. Any kernel later than about 1.15.0 would be probably too large. And it is very slow. For a 8/16Mhz machine like this, other multitasking options like Magic or Geneva are probably more suitable (i.e. faster).

I don't know what you mean here. MiNT doesn't included an AES (this is
the graphical user interface). The Multitos distribution from ATARI Corp.
included AES 4.1 (which was very slow and still effect the oppinion
about the MiNT kernel). Today FreeMiNT include XaAES as multitasking AES.

I don't know what to answer now. In general there are two
options: developing the kernel forward, making it better, cleaner more
configurable and more powerful or going back to TOS.

Nice answer, Frank :-)

Dows MiNT use loadable kernel modules, like Linux does? In that case, a
cleaner kernel with better/modern features could be configured in how
much emory it ' eats'. That is what I was heading for.

I have seen a TT with both a network card and a graphics card connected
to the VME-bus at the same time (and yes - both works ;-). So it's
obviously possible in some cases.

Well, in some respects it doesn't matter if a company that produces
hardware is 'dead' or a project is not supported anymore. If that
would matter we wouldn't be running Atari's would we ;-) So I think
Hades and Milan owners wil be very satisfied with their machines, and
that would not change very soon.

The Coldfire project I have been diving into a few days ago. The
project site(s) even have photo's of developer meetings (I finally got
to see the faces of some guys I see the nemaes of all the time ;-);
yet, the only real signs of life are the logs on acp.atari.org.

I really hope this project will succeed. I wish I could be of any help,
but unfortunately I don't think so (except for giving them my absolute
blessings and moral support ;-).

About ARANYM: I run it on my iMac. I have mixed feelings about this. It
gives a good opportunity to run the TOS stuff very comfortably, running
AFROS I have FreeMiNT and all goodies, a big screen with a lot of
colors, etc. But the Atari (and clones) line is not only about running
TOS stuff; it is a computing experience. TOS was not better than the
MacOSX I am typing this on; it is the computing experience as a whole
that compelled me to pick up my Atari stuff again. Including hardware,
it is like 'alternative computing' . And I like that. With all the ins
and outs of it.

Coldfire would fill this in perfectly for the next few years.

I remember running MiNT on a regular TOS box, with virtual consoles (in
windows) that I could call from a DA. MiNT itself didn't include an
AES. But hey, this was 1988 or so. Somewhere in between my mid-term and
long-term memory:-) I still have the floppies somewhere.

MiNT as a kernel was OK. At least even on a 8MHz machine I could still
multitask. However, back then very few programs exist that were ported
to MiNT.

I run ARANYM here sometimes, with FreeMiNT and XaAES and it runs perfectly.

Refards,

Hello,

The "Galaxy", from M. Becroft ?
Alas! this hardware has turned to abandonware :-(
However, what about a kind of "supervidel" for VME bus, including
Ethernet and USB as well ? Wouldn't it be nice ?

J.-Luc

4263. My MegaSTE progress report :-)

Newsgroup: comp.sys.atari.st
Date: 2004-08-05 20:34:53 UTC
From: Rene Kint <none@none.given>
Message-ID: <411299ee$0$57552$e4fe514c@dreader9.news.xs4all.nl>
Source record: 17658

Hello.

I keep documenting my progress here (and if it leads to intelligent discussions from the real connaisseurs, I think that's a blessing :-), amongst others with my floppy, memory, SCSI drive, ethernet, OS and other issues.

FLOPPY
Tonight I went out to someone who had put an Epson SMD-300/340 up for sale on his personal website. Originally he asked EUR 7,-, but after some nice chatting with a coffee he asked EUR 5 :-).

The Epson SMD-300/340 is a drop-in replacement (as already told here by Jim, airc) for the DD drive of the MegaSTE, wich is a Epson SMD-380. Yes, it fits perfectly, after some bending even the rectangular drive LED fits. The SMD-300 has more jumpers on it than the SMD-380, but I decided to let them just be there; I only switched the DS1 to DS0. (Later I have pulled those extra jumpers, but then read errors on HD disks apeared).

The drive didn't work. The LED was on continuously and the Atari reported Drive A: was not responding. However, turning the floppy flat cable upsode down solved this problem.

So it read HD disks perfectly now. But I also want the MegaSTE to format the floppy with 1.44MB. Somebody here said I should switch dipswitch #6 (front right on the motherboard). So I did. Still, TOS doesn't give me a HD choice in the FORMAT menu. Anything else I forgot?

MEMORY
I bought 4x1MB 80ns SIMMS on eBay from a guy in Germany (for EUR 1,99 + 5EUR shipping). He will send them to me around 15. August. More around that time.

OS
I will give SpareMiNT a try these days. First I will have to fit a floppy into a PC to download the stuff and put it on disks. Hey, I must not forget to buy a box of diskettes...:-) I have experience with RPM on Linux, so the SpareMiNT approach seems just right to me! Remember, this is a 2MB machine, but I'm going to give it a spin anyway.

Sparemint might be a tough run on a 4meg machine, but by all means,
purchase an EtherNEC from http://hardware.atari.org. They run perfectly.

Lonny,

Looking at the TT schematics there are indeed some termination resistors on the motherboard. It's possible that these would need to be removed. I have seen VME terminator boards before, and in fact there are some on evilbay at the moment. Perhaps it is possible to extend the TT's Bus into a VME backplane in an external rack?

Coda.

I suppose this would require some bastardized implementation of TOS 4.04 and in addition would require simulating a videl on a machine that didn't originally come with a videl. This seems like it could be a HUGE amount of work. Alternatively you could make a supervidel vme card and have a drier that forces the system to recognize it just like any other gfx cards, but then falcon software that natively uses videl xbios calls may not work properly?

It's an interesting concept. Can Falcon hardware be backported?

You also might want to check this site out:

http://stlabs.free.fr This looks very cool! and is promising. A final solution to get a proper amount of ram into your mega ste. With 16 megs of ram and a good video card, MiNT + n.aes should run pretty well. Sure web browsing won't be too fast, but it's a nice atari system nonetheless.

The one I saw had two VME-ports. This was made possibly by simply
daisy-chaining a second VME-port (from another TT) to the original. No
other modifications IIRC. However, there were limitations, something about
adress-space IIRC. I can't remember the details.

IIRC, the chips used to drive the bus in the MSTE/TT are not fully VME
compliant, ie. they do not have enough drive power to support a full
VME-compliant termination, so by adding a real termination, you may make
things worse.

However, if you keep the whole bus short and capacitive loading low, you may
well get two cards working by just paralleling them as is.

Someone may have kit here for sale, but it doesnt turn up very often. You need to hang around here and the other atari forums, post some requests and see who's got what for sale, oh and keep an eye on ebay. Youre unlikely to get what you want very quickly though, but I guess that'll be fine by you ;-)

> of the hi-powered clones that were (merely) rumors when I kinda bowed
> out of the Atari scene up and available now? I hit google but came back
> with somewhat mixed results.

Depends when you left the scene. Milan's came and went, so did the Hades. These are extremely difficult to get now, though you can get a 68060 card for the Falcon called the CT60 from www.czuba-tech.com but the last run may have sold out by now. If you want a the quickest ATARI that will run the majority of existing software, the CT60-Falcon is your best bet.

There is work going on at http://acp.atari.org to build a new clone based on the Motorola Coldfire.

Yeah I even see MyAtari on eBay trying to buy stuff for cheap to resell for a arm and a leg. lol
Best to check eBay, no matter what it will be cheaper than the dealers. But if you want a new or mint setup and price is not a issue, check the dealers out.

4286. Ethernec - ANYONE?!?

Newsgroup: comp.sys.atari.st
Date: 2004-08-08 04:10:09 UTC
From: Rory McMahon <fujiman@netzero.net>
Message-ID: <070820042310092317%fujiman@netzero.net>
Source record: 17682

Seriously,

Is there anyone that is making the Ethernec other than Amsdon? I have sent several emails to him over the last 2-3 months, and his only communication is to ask how many I needed. I told him I needed 3 total or circuit cards to make 3, because I have the parts. Anyone else have PCBs?? I'm tired of being put off... can anybody step up and fill this request?

thanks

4287. Wanted Mega STE - TT030 - Falcon030

Hey gang. Long time, no see/hear. :-)

Big time into Linux now - got 3 desktops and 1 laptop running Mandrake v9.2 on a LAN here but I'm looking to ease back into the Atari world/scene a little at a time.

I've still got a functioning Mega ST (4 megs/16mhz Adspeed) that I used to run the DarkForce! BBS with - 4 gig HD, EZ135 drive, etc, etc, (and TONS of utility apps/games).

I'm looking for some other hardware though, as the subject line says. I looked at B&C and Best Electronics here in the US but the prices (I think) are higher than when I originally bought Atari equipment when it was released <grin>

Anyone got some good sources for hardware? And along those lines, are any of the hi-powered clones that were (merely) rumors when I kinda bowed out of the Atari scene up and available now? I hit google but came back with somewhat mixed results.

Thanks everyone! :-)

Sure that's possible !

The only things to be checked are chaining of the INT.
The REQ/GNT pairs chaining questions are out here because the VME bus of atari are only SLAVE ! Cannot be MASTER !

The atari VME is like a pure 68000 bus, like the Mega ST bus slot...
Easy...

Yo, I had a Milan 060 so it's definately no rumour or vaporware. It
was a nice machine but I had to let it go.

I find that you have to pester people for them to sell you something.
Hardly anyone will respond to a wanted ad unless they really want to
get rid of some stuff. What I do is go on IRC on one of the Atari
channels and talk to a few mates and I find what I want most of the
time.

Hello.

I recently came back to the Atari 'scene' and I must say a lot has changed (some for the better!).

However, I do feel the same about getting those 'mixed feelings' when browsing for Atari-related hard- and software. Some of them are 'about to be released' or 'just released' but the website is updated in say 2001....The Milan site is almost gone, and for most hardware/software projects the status is at least unclear. Some products are still available commercially but abandonned at the same time (like MagiC).

About getting stuff: I find my stuff on eBay and the likes. The MegaSTE itself was no problem; still got it (although I have SPANKED myself for throwing away a 1040STfm and a Mega ST2 just a year ago!).

Most 'upgrading' is doable with 2nd hand stuff: memory, harddisk, floppy drive. (speaking for my Mega STE, that is)

But the more advanced stuff (ethernet, graphics, etc.) is more difficult. There are some really goodlooking products out there but somehow it is not too easy to get them. I wish there was a good portal or so showing the status of eacht project, what to use it for, specs, and of course ordering info on-line (or maybe even direct!).

Having said that, my quest for 'getting back' has been very nice until now. I can recommend it to you ;-)

Regards,

Renï¿½

There is one in the German Maus groups
maus.computer.atari.mint_mtos
As it is a German group you have to post in German.

For the mailing list you've to send an empty mail to:

mint-request@lists.fishpool.fi
subject: subscribe

All items below available for listed price (US dollars) plus USPS
Priority shipping. All items worked when last used, though none has
been used recently; as such, I make no guarantees as to functionality,
and all sales are final.

This is the last post, I promise... if no one bites, these things are
going in the trash, because I need the space. :-)

Magic Sac Mac emulation package - $15
(includes cartridge w/ROMs, 5.91 software, Translator One,
cables, manuals, Epstart)

Magic Sac Mac emulation package - $15
(same as above but with 6.1 software, no Epstart)

Magic Sac Mac emulator cartridge - $10
(cartridge w/ROMs and manual ONLY)

Spectre GCR Mac emulation package - $15 (have two available)
(both include cartridge w/ROMs, cable, manuals, 3.0 software)

Payment accepted by money order or PayPal. Thanks!

Hello,

Next friday I am about to pick up two SCSI drives of 2.15GB each. The goal is to put one of them in my MegaSTE.

I have a question about the SCSI termination, though. Should the drive terminate the SCSI bus or not? I read somewewhere that making the wrong decision about this on the feeble SCSI interface of the MegaSTE can fry the controller...so I better be safe than sorry ;-)

Regards,

Rene Kint

I can't remember whether mine is terminated or not. I cant get to my MSTe
atm so I can't advise.
You do realise that the MSTe will only see the first 1GB of the drive?

Coda.

Hi, Jan.

I know :-) But I could not get any smaller disks for 5 Euro.

I hope you will be able to get to your MSTe in time to answer, though :-) Maybe I will find out sooner, but you never know.

The end(last device) is supposed to be terminated to keep the signals from
bouncing back down the bus. Sometimes this is not needed but usually is. Too
many teminators could reduce the signal to where its not strong enough for
the devices to "hear" it. Do not terminat any devices in the middle of the
bus. I suppose its possible too many terminators could cause damage but
terminating the bus the way it was intended to definetly will not.

I will propose the CTEX ready to be used.

Price is 30 EUR.

Check www.czuba-tech.com
for info about CTEX.
It is a board to translate of 6 cms the CT60 to the rear of the falcon
box...allowing more space onto the CT60 and no more problem under the
keyboard.

RECORD YOU NOW : I need to know how much CTEX have to be manufactured.

Thanks

Clicking on the appropriate button produces a file selector for choosing
source and destination for the conversion.

Unfortunately not in my copy. Clicking on any of the 4 wide
buttons just open the file selector for 'File to save' - but not
one to load :-(

If yours works, I'll get a copy off you at the next CCC.

Message-ID: <cfga60$2hhs$1@ariadne.rz.tu-clausthal.de>
Source record: 17619

Hiya Atarians,

I've started a tutorial project with doing an GFABASIC tutorial for
beginners. It is aimed at people without prior knowledge in programming
and it will teach howto program and use GFABASIC on Atari ST computers.
Planned chapters include variables and data types, loops and control
flow, modularization, graphics, file i/o and probably memory management.
It is work in progress and additions will come chapterwise.
It comes currently as a webpage and I don't plan to add a fancy site
around it. I'll probably offer it for download as chunks with one
chapter at a time.

Check http://home.tu-clausthal.de/~ifmar/gfabasic/
Feedback is ofcourse welcome.

cheers,
Matthias

Source record: 17620

Check your host....
If you have the same one that is in the STacy (HARD DISK CONTROLLER
C103561-001),
for internal drives, it will only run 2 SCSI I compliant devices.

As it turns out, the STacy and the Mega ST/e, as I understand it, have the same provision for an internal SCSI drive. Those who got a Factory Spec Mega STe with an internal SCSI drive, most likely have the same host used in the STacy.

If this is your case DO NOT run a standard Daisy terminated SCSI chain.
Find the DIY for how to make a a STacy controller run 2 drives. You will most likely leave all the drives unterminated and use a very short hacked up cable. Reason being...with this Controller, you are using one DMA channel and two LUN IDs....hence the hacked cable. You'll need to make sure parity is disabled on the drives...OR...hack in a parity genorator chip (Also in Stacy DIY files). This controller can indeed run the Barracuda 1.2gig 50 pin SCSI II drives, just not the entire capasity of it (close to 1gig). I'm not sure about the UW SCSI II/III units, but with the proper adaptor it shouldn't be a problem.

If you have a true Micro SCSI controller, such as the ICD board, or the Link 96/97-internal, then simply follow the standard SCSI rules. Up to 6 devices (the host itself is 7) and only terminate the last device. The Link 97 hosts are likely the best...they can see large capasity drives, support parity, and in some cases even provide the Term Power if needed.

If all else fails, order a Link type host, plug it on the DMA port, and loop it back inside the case :) Really good internal hosts for the Mega ST/e or STacy are very very difficult to find these days.

Good luck!
Brian

P.S.

If you do have this controller in your STe:
Atari HARD DISK CONTROLLER C103561-001

You can hook ONE of the Baraccuda drives as follows:
Set drive jumper to:
Parity Disable
Get Term Power From Drive (Do NOT send any term power, do not expect to find it on the bus)
Drive ID 0 (This is a must)

Leave the drive UNTERMINATED...if you've set the Get Term Power jumper correctly, then a terminated drive should be safe...If for some odd reason your Barracuda drive insists on pumping out the 5v term power, make SURE this drive

is NOT TERMINATED.

Use a very short 50pin ribbon cable with SCSI connectors on both ends.

Plug it in, and you should be good to go!

Connecting a second drive requires the same jumper settings, but you'll need to build your own cable with some wires twisted.

Brian

Rodolphe,

I do not know if I need a CTEX.

Does anyone know if the SuperVidel is to mount under or over the CT60?
(Or does it matter?) It would be quite useful to be able to plug the
CT60 and SuperVidel in without having to solder connectors to either
the CT60 or SuperVidel. I do solder, but not well.

Message-ID: <cfhb59$7q0$1@reader1.panix.com>
Source record: 17622

Some time ago, somebody who knows and repairs laser printers in Australia mentioned that there is someone there who resurfaces such drums. I am also aware that most resurfaced drums do not last very long.

Whoever that is, they cannot be found with a web search.

I would like to have an address for that company. There are enough of those drums around to keep them busy with a long run of work. Shipping to and from Australia of a batch of dead drums should not be a big problem, or very costly per item.

Please?

Jim

SuperVidel card is mounting ON the CT60 bus.
Designers told me that the board will be able to fit on the CT60 and under the keyboard.
So, CTEX is not needed for SV !

But CTEX is good to correctly fix your big fan (the first CT60 run) on the heatsink if you keep the keyboard.
And CTEX is needed if you will put SV AND an other board like EtherNAT....or an other ;-)

Regards

Hi Galen,

> Does anyone know if the SuperVidel is to mount under or over the CT60?

The Supervidel is intended for the CT60 expansionslot, which is
located on top of the CT60. It would be very tricky to put it below
the CT60, as the F030 bus slot is in the way.

Hi, Brian.

I do have the 103561-001 controller, and I will connect only 1 Hawk
SCSI drive (this is not a Barracuda, it is a Hawk :-).

So, only 2 jumpers would be needed: "Parity Disable" and "TP from
drive", as I can see from your story.

Still, I do not understand why the Atari controller doesn't need the
"Term enable" jumper. Can you explain this to me in layman's language
please :-)

One problem still exists, though: I do not have the right
jumpers....these are very small flat jumpers on this Seagate 32151N
drives...anyone out there who has some spare mini-jumpers?

Regards,

Renï¿½

I'm pretty sure the SuperVidel plugs into the CT60's extended
expansion port (the full 32-bit expansion port on top of the CT60 that
interfaces with its 32-bit bus, SDRAM memory, and the 68060 directly),
so there shouldn't be any soldering needed (AFAIK). As it requires a
CT60 to run, I don't think it would plug into the Falcon's PDS slot at
all. So it wouldn't need the CTEX (which expands and moves the
existing PDS to a new location).

Currently, I have added the full png (with alpha) and 24 bits IMG's
support.

I have added also the writing support (only in JPG for the next version).

The next week, I will add a new extended info box, a preference's dialog
and I will correct some little bugs.

So don't expect the DSP support in the next version (I will try to
relaese it the next 10 days).

>>Don't forget, the application's name is "zview light edition" and not

Do you mean something like this ?

http://zorro.arcadia-crew.com/gfx/zviewbeta.jpg

As you see, the icons are in True Color and the look&feel is close to
GraphicConverter.

For the Futur, GraphicConverter and XnView are my "model"... but zview
is a Atari software so I work to make a lightweight and *fast* application.

> please :-)

I'm guessing here:
The host being used isn't prepared to terminate the 5v line (I forget exactly which pin this is, I'm 'guessing' it's 25).
I could be very wrong about this...but it might be that if you make double sure your drive is NOT providing term power, or even physically bend down that pin on the host, or even snip that one wire in the ribbon cable, things might be safe with the other lines terminated.

Please don't take my word on this! I just recall reading somewhere NOT to terminate the drive in a STacy...and use as short a cable as possible. Exactly where the possible overload comes from...I'm not sure.

> One problem still exists, though: I do not have the right
> jumpers....these are very small flat jumpers on this Seagate 32151N

Where are you located? I might have some jumpers this size. Seems like I got a dead Hawk around here somewhere. I'm in the USA. I don't mind mailing them anywhere in the world...how long do ya wanna wait is the reason I ask.

An alternative is to just find female pin connectors and a bit of wire.
Or...a quick solder bridge.

Brian

Yes. I mean this exactly.
But you can build in an option, what for files the user can see in this
browser.
I think, there should only picture files and now program files or RSC
files and so on.

The problem is *not* TERMPWR, but termination, which are two distinct
matters.

The drivers used on the MegaSTE host adapter do not have enough drive
strength to drive a SCSI bus that is correctly terminated. It can (without
modification) only handle a short cable with one drive attached, and that
drive may not be terminated in order not to overload the ICs on the HA.

Furthermore, the HA does not provide parity, so you have to disable parity
checking on the disk drive. All considered, it looks like Atari took some
shortcuts - this is definitely not a "SCSI hostadapter" (which would mean is
is fully compliant with the SCSI spec), but rather something that allows to
attach *some* types of SCSI drives.

Hi all,

I am fixing and extending the atari bootstrap (a program for starting linux-m68k from TOS) and so I would need to test the thing as soon as possible (Debian Sarge release is very near).

My changes are focused on Centurbo2 and AfterBurner040 but could affect also others so I would need to test it on the following machines:

- Medusa
- Falcon with FastRAM (Magnum, FX and whatever else)
- TT030 with 2 MB of ST-RAM
and of course the
- Centurbo2
- AfterBurner040 with less than 64 MB of FastRAM
- CT60

If there are owners of these machines willing to help me with the atari bootstrap and linux on atari in general then please send me a mail.

Thanks.

Petr

OK, now I am getting confused :-)

I have the following jumpers on the ST-32151N (Seagate) to put in my MegaSTE:

TP to Bus
TP from Drive
Reserved
Parity Disable
Write Protect
Motor Start Enable
Delay Motor Start
Term Enable

So, now the $1000 question: where should I place jumpers?

TP from drive is stated as being jumpered default. But, as already
stated, this is not your average SCSI controller, so....

I am very interested in your replies...!

Regards,

Renï¿½

4347. CT60 - CD-ROM

Newsgroup: comp.sys.atari.st
Date: 2004-08-14 13:07:56 UTC
From: vas.jozsef@karatnet.hu
Message-ID: <fe2e68f2.0408140507.7e069f95@posting.google.com>
Source record: 17642

I'm a new CT60 user. I use an external SCSI CD-rom. Before the CT60 it worked fluently. Now I removed the clock patch and did the SDMA patch. I recognized that the data coming from the CD-ROM are corrupt: every time when I opened a zip file, it reported CRC error at different files (I tried many files). I thought, that there is problem with the SCSI data. Then I connected another CD-ROM to the IDE bus. (slave of an IDE HDD) The data from the IDE CD-ROM are also corrupt. The HDD is working well. I checked both METAXBS.PRG and SPIN_SD.BOS and both of the "TT-flags" are unchecked.
I use Mint 1.15 and HdDriver 8.13.

Do you have any idea what to check?

Thanks in advance.

Well, if you are not going to do any termination, none of those are
jumpered. Term power to bus is not connected to the bus. The motor jumpers
interfere with a drive spinning up when power is supplied, so leave thos
alone.

Possibly you jumper Parity Disable. Should do no practical harm to do
that. I suspect that parity is ignored anyway, so it really does not
matter.

I suspect the bus power line is pin 26, but you do not need to bother
about that unless you really want to wire up power to the bus. It does not
look easy to do that.

In summary, should work with none of the below jumpered.

Jim

Theres no reason to have to do either.

Coda.

4352. GIM 0.3a Due Soon!

Newsgroup: comp.sys.atari.st
Date: 2004-08-15 06:59:14 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2004.08.15.06.59.13.683999@nosspamatari-source.com>
Source record: 17647

Hello folks,

Just thought I'd post a little teaser about the up and coming gim 0.3a. A lot of stuff has been done! Proportional fonts, and ability to change fonts on any area, you can click on a buddy in the buddylist to start a conversation, configuration changes are saved to disk using a poor method that will be fixed eventually ;-), I killed off the disclaimer and made some rsc changes, and made a slew of code cleanups. But I am not going to release until it is more useable still. I also want to make a thorough evaluation of the code and find out how to kill ALL of the libfaim debug code so it stops littering your consoles!

Lots more work and some screenshots to come. Things are very cool since 0.2a and I find myself using GIM more and more to hold real conversations.

You haven't heard a lot out of me lately and it's primarily due to my CT60 falcon being unstable. Well the problem was my own in overclocking without proper cooling. 50C is too hot for an 060! 45C is probably the highest you can stably go (at least on mine). When I get my watercooling rig, I'll crank it right back up there, but at least for now I have a stable falcon ;-)

Take care and have a safe summer everyone, and to the 1, perhaps 2, GIM users out there, I salute you ;-)

Thanks,
Mark

Source record: 17648

Well, here are my findings:

I decided to try it without any jumpers attached. I used the original MegaSTE Hard disk Utility Disk with AHDI on it and HDX 3.5.

At first sight, the disk behaved normally: during bootup, the drive spins up, the LED stays on for a short period, then it stays quiet, the disk spinning.

I used HDX for formatting the drive. HDX gave me the opportunity to choose UNIT 0, so I did. Then something strange started to happen. The very first time I did this, HDX started formatting. But HDX didn't give me any progress bar, so I had to keep staring at the drive LED to see if any formatting took place. After about 30 minutes of staring at the LED being constantly on (no hampering whatsoever, which I found suspicious) I decided to look for another disk formatting tool. At least one hat gives me a progress bar :-) So I switched off the Atari.

I didn't find any in my pile of Atari floppies. So I reverted back to HDX. But from that moment on, HDX refused. After selecting UNIT 0, it said that 'the unit doesn't exist'.

To check whether is was the drive or the controller, I hooked up my original 48MB disk, and it still worked. So the controller is still there. Then I hooked up another ST-32151N and it behaved exactly like the first one: 'the unit doesn't exist'.

So....no go yet.

The Atari sees a Unit 0, but not the attached disk.

My guess is we DO need some jumper setting...?

Regards,

Renï¿½

IDE problems have nothing to do with SCSI clock patch !!

Did you speak about 16 or 25 MHz bus ????
With 16 MHz bus and the 47 ohms as SCSI clock termination, SCSI runs fine.
It may be possible 47 is too low and you should use a 68 ohms.

BUT 68 ohms may be too high for 25 MHz bus speed : you need the 47 in this
case.

As you can see, YOU ALWAYS HAVE TO PRECISE THE FALCON BUS SPEED IN YOUR
PROBLEMS OR I CANNOT ANALYSE CORRECTLY !

In very rare cases, the 47 ohms should be parallelized with a 27pF capacitor
on it.

Sure, I assume you have well 33 ohms on R216, R221 & R222.

4356. Re: CT60 - CD-ROM

Newsgroup: comp.sys.atari.st
Date: 2004-08-15 15:07:56 UTC
From: vas.jozsef@karatnet.hu
Message-ID: <fe2e68f2.0408150707.5f4f541a@posting.google.com>
Source record: 17551

I know that IDE has nothing to do with SCSI. That's why I thought this
is a software kind of problem.
Anyway, the bus speed is 16MHz with 47 ohms termination resistor. All
of R216, R221, R222 are 33 ohms (I soldered R221 myself when I removed
the clock patch. The other two were already 33 Ohms)

I'd like to thank you, Rodolphe, for the great job you did with CT60
(also for the support).

You have been told twice that you need to disable parity checking on the
drive, which you have not done, and still ask why it is not working?

Hmmm. Does HDX 3.5 usually give you a progress bar? None of the formatters I have used give me a progress bar, and formatting can take hours. Yes, the drive activity light should flash. I think you have that disk drive thouroghly confused. And, if not, you have the motor jumpers done right, and may need to put one on to disable parity.

If you have confused the drive, what I have found that works is ICD install.prg.

I think they have those for download on their web site now, since they are no longer doing anything with Atari, and there is very little market for ICD Pro Tools.

So maybe you do need a jumper on parity pins. Try that first, and if that does not work, do a google search for ICD Pro Tools, and get those. If you cannot do that, I can zip up mine, and send them to you. I am using HDDriver 8.03, which I recommend.

Jim

Rene Kint <none@none.given> writes:

: Well, here are my findings:

: I decided to try it without any jumpers attached. I used the original
: MegaSTE Hard disk Utility Disk with AHDI on it and HDX 3.5.

: At first sight, the disk behaved normally: during bootup, the drive
: spins up, the LED stays on for a short period, then it stays quiet, the
: disk spinning.

: I used HDX for formatting the drive. HDX gave me the opportunity to
: choose UNIT 0, so I did. Then something strange started to happen. The
: very first time I did this, HDX started formatting. But HDX didn't give
: me any progress bar, so I had to keep staring at the drive LED to see
: if any formatting took place. After about 30 minutes of staring at the
: LED being constantly on (no hampering whatsoever, which I found
: suspicious) I decided to look for another disk formatting tool. At
: least one hat gives me a progress bar :-) So I switched off the Atari.

: I didn't find any in my pile of Atari floppies. So I reverted back to
: HDX. But from that moment on, HDX refused. After selecting UNIT 0, it
: said that 'the unit doesn't exist'.

: To check whether is was the drive or the controller, I hooked up my
: original 48MB disk, and it still worked. So the controller is still
: there. Then I hooked up another ST-32151N and it behaved exactly like
: the first one: 'the unit doesn't exist'.

: So....no go yet.

: The Atari sees a Unit 0, but not the attached disk.

: My guess is we DO need some jumper setting...?

: Regards,

: Ren&#65533;

Formatting is done by the controller on the drive itself and I don't think
its possible to get a status report from the drive, so you won't get a
progress bar with any software AFAIK.

Coda.

I have tested both WITH and WITHOUT parity disabling. I have gotten
answers in pointing BOTH ways, depending on the drive
characteristics/brand; some indicate that Parity is ignored, others
insist on parity having to be disabled. Even in atari forums you can
find different findings.

Both ways I myself got different findings while testing in the real world.

That's why I asked.

And about the solution: I found the driver software makes a big
difference, too!

You are right :-)

I have found the driver software being of utter importance as well.
CBHD didn't work, HDX worked SOMEtimes: with or without Parity Disable
I got mixed results, not stable.

The best result I got (in terms of stability) is Parity Disabled, no
termination and the HUSHI driver from SCSITOOLS 6.52. Almost perfect
(although the drive is sensed only after a reset, not a cold boot).

Regards,

Renï¿½

I don't know about this yellage from either of you, but from what I hear
parity absolutely must be disabled. Maybe it will work with it enabled
but there's absolutely no reason to ;) The Atari SCSI doesn't support it.
I think the Link 97 might but I guess you don't have one of those.

Thanks,
Mark

Parity *is* supported by the TT and Falcon and by host adapters like the
LINK96/97 or ICD link. It is not supported by Atari's ACSI hardware.

Is there a demo version of Extendos available to check if the CD
driver software causes the problem?

4376. Re: SCSI Terminator?

Newsgroup: comp.sys.atari.st
Date: 2004-08-16 22:11:33 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <rodUc.10$9o1.7@bignews4.bellsouth.net>
Source record: 17572

Get the HD-Driver 8 Demo.....
To find it, simply do a websearch for HDDRIVER ATARI or some variant of those keywords.
Set the following jumpers.

Parity Disable
Drive ID 0
Get Term Power From Drive (Do not send term power, do not expect to find it on the SCSI BUS)
Disable Termination

Some drives won't spin up at all without either sensing the 5v Term power is there, and/or jumper(s) concerning spin up modes. On these old machines, it's best to set your drive to always spin up when powered on.

Insert your boot-floppy copy of HD-Driver.
HDDRIVER.PRG should be in the auto folder.

Turn on the machine....
TOS 2.06 pauses and counts down....this is to allow hard drives time to spin up.
Memory checks...
For now, don't bypass these pauses and checks!
Once we know the hard drive is installed and working, you can experiment with how long it takes for things to spin out...and key out of these boot-screen pauses.

Older versions of TOS (shouldn't be an issue with a Mega ST/e) don't have the boot-screen pause. I.E. Some people have to cold boot while holding the reset button till the drive spins up, then let go of the reset button...or...load a floppy with COLDBOOT.PRG in the auto folder (so the machine keeps booting from the floppy until the hard drive has spun up), or get inside the machine and find a way to delay power to the Atari while the HD spins up (I'm guessing there might be some trimmers in there for this purpose).

HDDRIVER should boot from the floppy....
If it doesn't autoboot, go into the auto folder and double click it.
You should get a report of all SCSI/ASCI/IDE Devices connected BY MODEL NUMBER, and the ID it is using.
HDDriver is gonna report finding your Atari or Megafile type ASCI host(s), be there a properly set up drive attached to it or not....the key is...look for that drive model number as well! If you're not getting that...something is wrong.

If your hard drive is not reported properly.
1. After running HDDRIVER.PRG run HDUTIL, make sure the software is told to scan every possible Bus and ID for a potential device. IT 'should' be set to do

this default...but just in case, it's something to check! As HDDriver can be set to skip, ignore, rearrange the order, etc.....as it looks for drives on each BUS and ID. Note, HDDriver can address different BUS types...I.E. FalconTT SCSI, ACSI, IDE, etc. You'll need to make sure the bus you need is not disabled in the software.

2. Try scanning for devices from within' HDUTIL...if you're seeing it here, but not on the boot...see step one above.

3. Check other HDDriver Utility settings, save them on the floppy and reboot.

Try things from both cold and warm starts.....

No sense trying to format or partition anything until you see that Hawk identified by model number on boot with the floppy disk. Once you're satisfied the Hawk is being seen...you know it because the boot screen says something like. ID 0.0 Seagate STN######

If you're not getting such a report, having checked software settings.... CAREFULLY begin to experiment with your jumper settings....namely the motor spin options, and the term power.

When you see that HD reported properly....THEN formatting might be possible.
Boot the machine with your hard disk driver floppy.
Run HDUTIL
Shouldn't need to 'format' but if you want to make a truely clean start, I see no harm in it with a SCSI drive.
Yes...you should get a diologue or report of some kind as the formatting takes place. It CAN take quite a while so be paitent. Yes, it's true that SCSI drives format themselves based on SCSI commands sent to them....however; if they are indeed SCSI spec drives, they will also send status messages! So a status dialogue or bar of some kind should be present. I don't remember if the formatter does an automatic sector check or not...it won't hurt to run one in either case.

Finally...partition, reboot with the floppy again.
Make a desk top icon for Drive C, and see if it's there!
If so...use HDUTIL to install the drivers to the hard-disk's bootsector(s).
Take out the floppy and reboot.
You should be in buissness now!
Make your other partition icons....save the desk top, reboot, and start filling up that hard-drive :)

Once you've got an idea things are working...order a registered copy of HDDriver. You'll be very glad you did...it's really that good!

Brian

LOL,

The CT60 is definitively THE accelerator for the Falcon. But in your position I would hunt a CT2 Falcon or an Afterburner. I have huge doubts that anyone will give up their CT60 for under $500USD or more. I know personally that my CT60 Falcon has a $2500 price tag on it... and that's only to get me to consider the prospect of selling it ;-).

Thanks,
Mark

So I guess thats it then? No more CT60s at all? Pure shame, that. :-(

The afterburner is only 2nd hand now, right? Old hat.

What about the CT2? What is that? Do you have a link? Thanks.

For those of you who don't know him, Dave Troy started selling Atari computers in the USA when he was 17 under the name of Toad Computers. In 1996 (I think), he left the Atari market and switched his business over to being an ISP. Toad.net is still in business in Maryland.

I just stumbled upon his sales via Ebay of what appears to be his personal collection of Atari hardware. For those curious, they are viewable at http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=davetroy&include=0&since=-1&sort=3&rows=50
or just search under "Davetroy".

> > tell me about which one to use in what case?

If you have a 4mb or less machine.....
Geneva!

You're still running TOS off the ROMS...just replacing the single-tasking GUI with a multi-tasking one.

If you really care about a Fancy desk-top, NeoDesk 4 has some really nice features that none have matched to date, but there are some newer standards gaining popularity that NeoDesk falls behind in. At the least, you can use the Free TeraDesk, or no desk top at all! Of course, Thing, or Jeenie work just fine here too :)

99% compatable with all TOS/GEM software! Geneva comes with a task-manager that lets you easily select flags to insure compatability with most software. So far...I've only run into one application that can't run under Geneva, and that's Notator/Creator...which doesn't like ANY of the multitasking options but its own (Notator/Creator SL pretty much takes over the machine....and offers a Multitasking scheme of its own anyway). Yes! Even Cubase runs under Geneva!

Great 3d look in any Atari Resolution!
Really smooth AES, much faster than the built in GEM/GUI!
Low memory requirement.
This can also run as an AES for MiNT :)

If you do get Geneva, I highly recommend going ahead and ordering Geneva Macros along with it.
One can automate his way through just about anything! Somewhat like scripts...but even better, because it works even with ancient GEM programs that have no scripting support at all (even the ones that do not include hot-key menu items...geneva will let you pull down and select menu options mouseless....and GenevaMacros can record mouse movements and clicks as well...if you really need to do it that way :). A cool thing about Geneva that no other AES/Desktop offers to date....is that you can get at almost any menu, dialouge, button, icon, gadget without ever touching the mouse, and without memorizing strange alt-ctrl-key combinations! This makes macros a breeze! I.E. It is possible to use Geneva and Geneva Macros to launch on boot, dial into your isp, grab email, back-up your hard drive, grab news posts, send any messages you may have composed offline, start a fax program, send any that might be waiting...be on the ready for any incoming faxes, convert a folder full of color gifs to mono gifs, close out everything and start your favorite game 10 minutes before you get home from work. All using pretty much ANY software packages you so choose (not locked into those that 'support some flavor of scripting'.

The major advantage of Geneva over N.AES and XXAES is that Geneva can be run as a cooperative task switcher (without MiNT). OR, you can run it with MiNT, should you really need it for some reason (such as MiNT-NET).

By all means....even if you don't get any multasking AES.....DO GET NVDI! This will make screen redraws MUCH faster. It offers a GDOS that supports GEM bitmap, True Type, and Post Script fonts. It also supports several of the more fairly modern color printer languages (ESC2, HPCL5, etc...).

If you do much printing at all.....
Know that Atari really did a super crap job on the printing routines in TOS!
MagiC didn't do much better on this part of their TOS replacement.
I strongly urge you to get something like OutBurST or iPRINT.
These are commercial patches that replace all the printer routines in TOS or MagiC.
For anyone who prints with an Atari...this will be the best money ever spent on an Atari.
Such patches are not all that expensive.
It will cut printing times of any type by more than half! You get MUCH faster routines, and proper configurable printer buffers. If you use a GDOS based application, or something that rasterizes its own fonts (like Calamus/PageStream/AtariWorks/Tempus/Papyrus), you'll quickly notice improvements in print times up to %300!

MagiC...
The best thing about (with HDDriver) this is that it supports long file names (VFAT), has more partition letters avilable, and supports larger drive partitions. A well set-up HD-Driver/MagiC hard-disk has the potential to be highly portable to DOS/Windows machines. If you want/need this...it might be worth it to own if for no other reason.

MagiC alot smaller and Faster than MiNT/AES with the ST class machines.
It does a better job than the Standard TOS with things like background printing, background disk access, etc......
So long as you are running true GEM apps...the newer the better...this is a really sweet setup on a low memory Machine.

I have a CT2b Falcon, and two ST class machines. They each do some things better than the others.
If I only had to choose ONE for a stock speed Mega STe with 4mb....I'd personally go for Geneva, and tinker with MiNT on the side.

Brian

I exchanged emails with him. Some of these machines are demo machines
from the store or extra machines he has. They're most likely not his
"pride and joy" machines ;-) That falcon is a great CT60 candidate and
still very reasonable price, but I know it'll go up to $200 or so. Good
for him, unfortunate for everyone else ;-)

The CT2 was the predecessor to the CT60 from czuba-tech. It's older and from what I hear a bunch more complicated to install... in addition, I don't think you'd ever find a "CT2" for sale on ebay. What you'd find is more likely a CT2 falcon. I don't know, ask Rodolphe, http://www.czuba-tech.com. He probably has a couple CT60's left that he could sell you.

Thanks,
Mark

It may be a good idea to send me an email to REGISTER you to RESERVE a CT60
!!!
You know...2 guys are waiting for their CT60 after the 80.
This means that you will in the 3 rd position...

AND there are yet 14 guys that have reserved and not confirmed they buy
and, nextly, the "NO MONEY = NO CT60" will arrive (I cannot wait a too long
time !).

CONCLUSION :

If 3 guys cancel their reservation, you get ONE CT60 !!

In the life, move and speak after...

Regards

Rodolphe

Okay, I understand. I've sent an e-mail (2nd) to the following address:

rod-yenamarreduspam-olphe.czuba@free.fr

That is the correct one, right? Anyways, I'm asking, please to be
registered.

Thank you. (and many thanks for continuing to support the Atari community
with such excellant work!).

I agree. If you are limited to 4 Mb, either Geneva or MagiC will be your best choice. The two OS variants can be debated endlessly, but in a nutshell, Geneva has the best compatibility while MagiC has a better feature set (preemptive vs cooperative multitasking, for example). I own both, and personally prefer Geneva/NeoDesk.

If you're sticking for the most part with ASH applications (or those that really make an effort to support nicities of MagiC), and you design your suite of software around MagiC. I think you'll be pleased. This platform design is intended to set some standards and move TOS machines forward in the way one works with a computer.
MagiC-keen software-authors communicated a good deal about standardizing the look and feel of applications...I.E. lets everyone use/organize pop-ups, windows, dialogues, and menus the same way, for the same reasons...so that Emailer will behave much the same way as CAB to the user....it's an organized thought process that gives you a very uniform look and feel across all of your applications... I.E. control C will 'copy the block to clip board' in almost any ASH focused application ever drawn up! They all know that clipboard is there, and they all use it the same way. You'll find the same to be true for MiNT/N.AES/XXAES.

If you've got piles and piles of old software from all over the world, hardly following any standards other than some rather old and outdated outlines of GEM...you'll find Geneva offering a plethora of options simply not avilable in MagiC. These options will allow you to create you own standards...even with really old applications done up before there were recommended and truly followed standards (such as the clipboard copy and paste with consistant hot key combinations). I've found that many of the nice new ideas that have come about for MagiC/MiNT....such as a standard protocol for scripting, and the AVSERVER, etc...while Geneva isn't up to date on all that...there's still often a way to achieve the same result (yep, even with ancient softwares that didn't follow any 'working method' standard at all.

The cooperative vs preemtive multitasking...
On an ST....I doubt that you the user will notice much difference with one exception. Disk access, and certian calls that hog the system where GEM is concerned (I.E. dialogues often lock you out of doing anything else until you've clicked through, or the job it does is complete. Printing is a good example (without a spooler). MagiC, when combined with HD-Driver, and cleanly written multi-tasking aware GEM software will allow you in most cases, to keep on working when a disk is being accessed (or run processes in the background), and in some cases even print in the background and go on about your buissness with another application. Again...most apps that perform well on an ST don't require much disk access anyway...here, your specific needs dictate best.

On a 4mb ST machine...you're not likely to be running many things at once anyway....
As an example running 4 typical GEM apps under Geneva or Magic...I doubt you'll notice much difference in how 'zippy' the machine feels and reacts to you, the user.

I have and use them all (Geneva, MagiC, MiNT/AES4_1/N.AES/XXAES), and like them all for different reasons....
Being a MIDI person....I find I put more time in with Geneva in cooperative mode than any of the rest.

Geneva CAN INDEED be run as the AES on top of MiNT. This makes it preemtive! With older kernels and a time slice of 2 or 3 (On an ST) it's quite useable...and the older kernels leave enough memory to get some useful multitasking in.
I personally don't find any advantage to this unless you want a minix/ext2/VFAT partition, or intend to run MiNT-NET, or wanna dive into some of the Unix/POSIX possibilities.
As one moves into more modern kernels, to support things like VFAT/NEWFAT, ext2, latest C libraries, true SPAREMINT upgradabiltiy...you're not gonna have much memory left for anything GEM anyway! In ST-Medium or ST-HIGH resolutions....I personaly recommend using virtual consoles for all the unix stuff...and avoiding GEM unless you really need it for something. Ya don't have colors anyway...and not much room on screen for lots of windows...might as well just 'swap screens with a function key' rather than trying to run a memory/rescource hog like TOSWIN.

As an AES for MiNT.......
I find Geneva FASTER than any of the others!
Some of the newer AES standards are not fully supported of course....but yep...it's more responsive than any of the others (Using a Falcon CT2b with the last EasyMiNT installation).

If you do wanna tinker with a full unix mint setup on an ST....
I'd set aside two partitions....put KEMG (OR KGMD if you're german speaking) on the first one.
Get famaliar with that....and later try SpareMint on the second minix partition.
For a 68000 machine....ext2 isn't well tested, if at all. It's likely to slow things down a bit too. Prolly best to stick with minix on an ST (unless ya just wanna try it...be the one to test it ;).

That's pretty much why I say, for an ST class machine...get Geneva first....
Add the others too if you can afford it and enjoy your Atari that much, they're great :)
It's just that here in my workshop....with the Mega 4, STacy 4, and Falcon CT2b...Geneva, cooperative mode, with a STing based network, is the beast that gets the most hours trouble free use.

Brian

4401. Eiffel Disaster Recovery?

Newsgroup: comp.sys.atari.st
Date: 2004-08-18 21:56:41 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <cg0jap$l4d$1@news5.svr.pol.co.uk>
Source record: 17596

Hi All

Thought things were going too well....

I had just downloaded the latest version of the Eiffel Config Program v1.0.6, and had selected the HEX file to update my external Eiffel device. Then I selected "Program Flash" and the Eiffel mouse/keyboard lights came ON, also the Num/Caps/Scroll Lock lights were ON on the keyboard. When all the Update radio buttons had turned to their lighter shades I assumed the program had done its job - even though the lights on the Eiffel and Keyboard were still ON. The Mouse or keyboard didn't respond!

I reset the Falcon CT2b, but no keyboard or mouse were operational when I got back to the desktop!

I managed to recover (from a backup CD) version 1.0.4 of the Config Program but various attempts at unplugging the Mega keyboard and quickly plugging in the Eiffel have probably failed to Program the Flash with the old version of the firmware!

Can anyone else help?

Will the main chip need resetting with an external programmer? Lyndon Amsdon made this Eiffel for me, but he is too busy with his job now.

Neil :-(

Hrmm, Well GIM doesn't work under MagiC. So, the possibility exists that someday it may work with STiNG/Gluestik but it's never going to work without MiNT because I won't do the work required to remove the dependency on the MiNTLib (and hence MiNT kernel) that the faim library has. The faim library has these dependencies because it's a straight unix port and it's one of those less avoidable things. It dies sometime during the signin process. I suppose I could try to link it against that old mintlib (separated from MiNT kernel) archive that I found and see if htat works.

If this does happen, you can try using a serial PC mouse on the modem
port with a suitable driver and leave the eiffel connected to
reprogram it.

If you don't have facilites to do that, you can send it to me. It
only takes me 5 mins to program it.

Lyndon

Sir, I understand and I've already apologized. I will again. I apologize.

I guess I'm spoiled by Linux. Spamassassin here basically destroys the
concept of spam.

I did send an e-mail via the address on your web site. I hope it got
through. I understand that I would be on a waiting list.

Thank you, and good day.

You need a firmware 1.0.6 without debug whith the Lyndon's card because
there are no pull-up on RB5/RB4. If RB5 is read to 0, eiffel start in
the laurent Favard debug mode and the serial port is set at 9600 bauds,
so the communication with the motherboard can't work.

> Can anyone else help?
>
> Will the main chip need resetting with an external programmer? Lyndon
> Amsdon made this Eiffel for me, but he is too busy with his job now.

Try to set the power with the FIRE button of the main joystick, eiffel
start with the residant firmware, not the firmware flashed by the Eiffel
Config program.

Regards,

Didier.

It happened to me once... a few mails with Didier later, I tied both
pin 25 and 26 to +5V via 2 4,7K resistors, flashed a special version of
the 1.0.6 firmware, and it worked again :-)

Transfer in CT60 mode a big ZIP file from IDE to SCSI and check it in 030
mode !
This tests SCSI WRITE !
EASY !

Same in the other sense : transfer a ZIP file in the SCSI in 030 mode.
In 060 mode transfer it to your IDE. And Check it in 030 mode.
This tests SCSI READ !
EASY !

The ZIP file should be 10 MB at least and select the higher video mode you
can (with Centscreen you can work in 65K colors in 640*480 and I recommend
you that for the SCSI tests !!).

Regards

The result of the testing:

I couldn't test SCSI writes, since I have only a SCSI CD-ROM.
030 mode :
IDE-CD to IDE-HDD : OK
SCSI-CD to IDE-HDD : FAILS (rare CRC error, almost OK)
IDE-HDD to IDE-HDD : OK

060 mode:
IDE-CD to IDE-HDD : FAILS (even Thing is terminated, copy failed)
SCSI-CD to IDE-HDD : FAILS (lot of CRC error)
IDE-HDD to IDE-HDD : OK

I did the file copies in the specified modes and the testing in 060 mode.

Hi All

Thanks to everyone, I have use of the mouse and keyboard again thanks to
Didier's joystick FIRE button tip. I reflashed to v1.0.4 of the HEX.

But as I type here I just noticed, instead of "double u" I'm getting "2"
2hen I press that key, and shift-double u produces ".
Is there something 2rong 2ith the keyboard? Or can this be corrected?

Didier is there any chance of obtaining a v1.0.6 2ithout debug you
mentioned in your reply?

Thanks

Neil :-)

Try to use Init Keyboard Table inside EiffelCF.

I remember David Troy. I still have some of the old Toad Computer
catalogs. Too bad he is selling his own personal Atari hardware. I
would have thought he would have held on to it all as a reminder
of years past.

If anyone want to really spend the money, then I would just get a
Milan or a Hades060. Evenm then, these machines still cannot run
all the software that the Falcon does. Believe you me, I have
tried on my Hades with no results.

Nope, the STe disk isn't recognised on the PC prob because of the different format needed to be read on the Atari as defined by HDdriver 8.

Thanks anyway.

Hallo !

J>Is there any way that a zip disk written on an STe can be read on a PC
J>or vice versa?

Yes, at least provided that the zip disk isn't formatted to TOS format, but used as it came (in PC format). This requires a decent harddisk driver and operating system, though. There's also a special format option available with HDDRIVER (commercial harddisk driver from Dr. Uwe Seimet), that makes harddisks (and that's what ZIP's are) both TOS- _and_ DOS compatible.

With best regards
Ekkehard

P.S.: Yes, I know. It isn't format, it's just a special partitioning scheme :-)

I don't know if this works on a STe - it surely works on Hades 060 and
TT 030 - just partitionate the disk with the "TOS & Windows combined" option
set to on. This way you can use the zip on STe, pc and even on a Mac.

I'm doing this since many years now.

I tried it but, because I'm not using Magic or Mint, it doesn't work. Any other ideas would be gratefully received.

Hm... Maybe you can give BIGDOS a try. With BIGDOS single TOS will be
able to read DOS partition >32 MB

Or you can make 3 partitions of 32 MB.

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork.
For both computer and monitor $250.00 Plus shipping.

JPGs available upon request of the whole setup in action.

GAMES

Annex by D. Pritchard. An DOOM Alien shootem up game.
Docs, disk $5.00

Bridge 4.0 by Artworx. A comphrehensive contract bridge-playing
program. Box, docs, disk $5.00

Captain Blood by InfoGrames. An involved space game of exploration.
Box, docs, disks. $5.00

NightBreed by Ocean. A game based on a Clive Barker book/movie.
Box, docs, disks. $5.00

Renegade by Mastertronic. A Star Raiders type space shooter
type game. Manual and disk. $4.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Sinbad and the Throne of the Falcon by Cinemaware. Docs and disks $5.00

Transartica by Silmarils. A Falcon030 game where you are
the captain of the a Train on the frozen planet. Docs, Disks. $15.00

MISC SOFTWARE

DC Shower by Double Click Software. Replaces the TOS "Show" button
when double clicking on a file from TOS. Many different types of files
can be manipulated like graphics, compressed files, and HEX.
Docs and disk $5.00

Degas by Batteries Included. The classic graphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.
For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

Flash by Antic Software. Complete Gem based telecomunications program.
Has VT-100, CIS, Vidtex Graphics capabilities and more.
Box, docs, and disk. $3.00

Fuji Linux 3 CD-ROM set. This a full Debian 2.2r0 installation of
GNU/Linux for the Atari Computer. For more info go to
http://www.linux-m68k.org $10.00

Grammar Expert by Phil Comeau Software. Grammar Expert provides easy
access to the rules of English grammar. It also provides advice on
effective writing. Docs and disk $5.00

Image CAT by Wiz Works. The complete graphics cataloging system
for all Atari computers. Print a catalog of image files that you
have on your Atari or view the images on your screen. Docs and disk $5.00

PrintMaster Plus by Unison World. The ultimate designing program
for the ST to create banners, cards, posters, calendars and more!
Box, disks, and docs $5.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Box and disk $3.00

Stalker 3 by Gribnif Software. A great GEM based telecomunications
package. The most complete telecomunications and terminal program
produced for the Atari. Can be run as a desktop accessory which then
allows background downloading and more. Box, docs, disk $5.00

Ultimate Virus Killer by Oregon Research. Protect your ST and repair

4441. Q: replace Hard D with floppy on STacy

Newsgroup: comp.sys.atari.st
Date: 2004-08-23 01:19:16 UTC
From: yf110@vtn1.victoria.tc.ca
Message-ID: <41293804@news.victoria.tc.ca>
Source record: 17536

Hello.

The hard disk from my STacy doesn't work (that's why it was given to me eh).

I have an original atari 720 K floppy in a 520 I don't plan on using anymore.

I want to take the floppy from the 520 and put it in place of the hard drive in the STacy.

Will this work? Will I be able to simply plug in the second floppy to some kind of existing connector? Or would I need some additional gizmo to allow the second floppy to plug in to the main board?

If anyone knows or has links to intructions for this then I would appreciate them, thanks.

Why dont you just get another hard drive?

Coda.

4443. Concise Atari Falcon accelerator listing/details?

Newsgroup: comp.sys.atari.st
Date: 2004-08-23 13:47:36 UTC
From: "Ronald J. Hall" <darklord@darkforce.ky.org>

Source record: 17538

I was just hoping that someone has a URL to a site with clear details on
the current state of affairs for accelerators for the Atari Falcon 030?

I was hoping to get a CT60 (drool!) but it appears that I've re-entered
the Atari scene too late for that one... :-(

Thanks everyone!

There are, to the best of my knowledge, no current Falcon accelerators
underway.

There is a project called the "Atari Coldfire Project" that hopes to
create a TOS compatible computer. They have not yet succeeded.

There are also plans available to boost your Falcon to 25Mhz, allowing
for 640x480 16 bit color and a 10-25% speed improvement.

Finally, there are continual improvements to Aranym, and I expect the
day to soon come when you can take a Linux box and have for all
practical purposes a high speed TOS computer. If a stock Falcon is
not providing sufficient power, this is likely to be your best bet.

Galen

4445. Re: Eiffel Disaster Recovery?

Newsgroup: comp.sys.atari.st
Date: 2004-08-23 19:53:41 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <cgdi05tpi1@newsg2.svr.pol.co.uk>
Source record: 17541

Thanks Didier, the 2/W problem cleared when I rebooted. I obtained the Lyndon version from your website and flashed to v1.0.6 successfully. Everything working fine now. I also installed Picdesk in the Auto folder to gain the extra keys Pg Up & Pg Dn - as I am using an old AT Keyboard no Windoze keys are available.

One question about Picdesk is the "Vitesse Falcon" CPX module which highlights the "8/32" button for my machine - is this correct?
My machine is a CT2b Falcon - I assume it is 50MHz, although I can't quite remember if the mainboard is boosted, but surely it should be higher than 8MHz!?

Thanks Derryck for emailing about the Eiffel problem, looks like I won't be needing a PIC programmer after all! One good reason for keeping a joystick even though you haven't played a game in 6 years...

Neil :-)

: Why dont you just get another hard drive?

The atari with nothing but floppies is a totally silent computer, which is one of the key reasons I still use an atari for some things.

Also, I don't need a hard drive for anything I do on the atari, and so I don't wish to spend the money on one at the moment. (I actually have a 45 meg atari hard drive already if I really needed one - but I haven't used it for years, except to copy the files to a PC as an archival backup).

I'm working on a guide right now:

http://portal.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewarticle&artid=27&page=1

I have some other guides there. This one in particular is not done yet.

I also plan a newbie guide introducing a returning Atari user to the
community and what they can do with their respective hardware today.

Thanks,
Mark

Mark, thats great. It'll help people like me... :-)

Well, actually, I've never *totally* left the Atari scene - I kept a Lynx,
Jaguar, and a Mega ST. I sold my Falcon, which was equipped with a Nemesis
and in a Desktopper case. Sure have missed it though, should have had my
head examined for selling it in the first place. :-)

And every time I think about the possibility of getting a $1000+ payout for my CT60 falcon and all accessories I remember how much I missed my Mega ST2 and why I paid over $100 for my Mega STe and bought the Falcon in the first place after all those "Atari absent" years ;-)

Fact is a falcon is worth so much anymore because people don't want to get rid of them ;-)

Ahhh got SICK of hear about emulators, emulators and emulators. I use
real Atari hardware, why use a emulator that only can play, barely,
games ...

Throw the PC in the WC...

Use real Atari...

MrAtari

Wow,

It would be great to win this auction. Not only do I need two eiffels for
myself since the Qwertyx is incompatible with the CT60 (sort of), but I
love soldering components into PCB's. I find it relaxing ;-)

Good luck!

But remember that Lyndon really had to spend much time on soldering...
Though one might never be relaxed enough.

Regards,

Alexander

I got one of these recently - saved from a skip !

Is it worth keeping / what can you do with them ?

I stuck a few ST disk that I have through and most won't work, probably
because of the mono screen (?)
The old TOS isn't great either.

Any advice about what to do with these things ?

In the USA, No. Those were the first 1040 machines, they came out in 1985.
Very common.

The Mega are more rare that the 1040s. If it is in good shape its worth
keeping. Did it come with a keyboard?

I've got plenty of time to do this stuff, but I get sidetracked easily ;-)

I want to think I am the right person for the job but I don't know. As
long as I can find an american source for parts, and I'll probably use
PCBexpress or order more from the UK houses. I mean if cost isn't too
high, I'll just see how many Lyndon built and order enough to build half
that, build and sell.

That's if I win.

No. You can not plug a floppy drive into a hard drive connector, it just
won't work and you risk causing damage to the floppy drive and maybe
even the STacy.

Add a hard drive. It makes very little noise.

: No. You can not plug a floppy drive into a hard drive connector,

Well I realize that, thanks. The question was whether there is some other connector aready in place that can take the second floppy - after all, one of the original configs of the STacy had two built in floppy drives - I thought perhaps all I would need is the right cable to do it. But it sounds like that is a no.

: Add a hard drive. It makes very little noise.

Just like my DPS12 makes "very little noise"? I tolerate that cause I have to. I think I'll just keep it the way it is for now, adding a hard disk won't turn the atari into an uptodate computer, but a single floppy still works fine for midi and for checking my mail and for writing in the middle of the night.

Anyway, thanks.

Are you sure about this? If that is the case then you should be able to fit
another. I have never seen stacy schematics but the way to add a second
floppy on other ataris (bar falcon) is via the floppy port at the rear of
the machine. You are going to have to open up the Stacy to do this, so why
dont you have a look at the floppy cable, if there is two connectors on it,
and whether the middle connector is twisted. I guess that neither will be
the case. You will probably have to get a PC floppy cable for both
connectors. On the second floppy set the drive to DS1 (a PC floppy drive
will be already set to DS1 as standard so try this first if youve got one to
hand). If it doesnt work, reverse the twist in the middle of the cable
(drive B) to create a straight thru cable, then try again.

> : Add a hard drive. It makes very little noise.
>
> Just like my DPS12 makes "very little noise"? I tolerate that cause I

Whats a DPS12 and why is it noisy? New modern HD's are near silent (except
2.5" laptop drives - I think they make em noisy on purpose :-)

Yes. I read somewhere that the keyboards were meant to be much better than
the standard ST ones.

I got a colour monitor working on it and it seems to run very well.

What's the view on TOS upgrades with such things ? I'm not sure if the
upgrades would fit these, but is it best leaving them as they are ?

Is there anything that works on these that doesn't work on a standard ST ?

These (ones that I saved recently) are 87/88 versions, mostly 520. I'm in
the UK so I'm not sure if they are so common here (?)

These were used in a school for music applications, so I guess they could be
fairly common - but schools like this one chuck them out. If I hadn't
collected them, they would have gone in a skip.
I find it sad that decent machines like these that are basically in good
working order get dumped.

It fits the later M(STE) and TT. Several users on here seem to have lost
their keyboards
and need replacment.

If you want to play games leave as it is. Many games won't work with a new
TOS.
If you wan to do serious stuff look for a TT or better :-(

> Is there anything that works on these that doesn't work on a standard ST ?

They usually have a blitter. So if you need a blitter ....
Other than that they are identical to a stock ST except they have a VME (is
it I forget)
slot so you can add graphic upgrade. Also clock is battery backed up.
And there is space for a hard drive....
On the down site (perhaps?) no modulator so you need a monitor..

Hello everyone,

For some reason my backup script decided to instead delete everything on the system. Nice huh? After researching undelete tools I'm under the impression that I'm screwed because it doesn't know the cluster sizes for each file that is deleted. Is this correct?

Thanks,
Mark

Is there any way I can get this stuff back?

The cluster size can be calculated from the boot sector parameters,
which are still valid as long as you did not re-partition your drive.

> Is there any way I can get this stuff back?

Tools like DISKUS (German only) help with that,
http://www.seimet.de/diskus_english.html

Hi, Malcom!

MD> Just like my DPS12 makes "very little noise"? I tolerate that cause I
MD> have to.

You know that hard disks can be 'shipped'? Most hard disk drivers have
tools for this. It makes the disk spin down - and then it is absolutely
silent. It will wake up with the next access. So you can boot up from hard
disk, ship it and enjoy the silence ;-)

Steve has got a Mega ST, not a Mega STE, so there is no VME bus, but a
MegaBus. There are Graphics, Ethernet and FPU cards for this slot.

I'm not sure wether a hard drive can be added into a Mega ST case, may be
some 2.5" devices.

Hi, Mark!

MD> For some reason my backup script decided to instead delete everything
MD> on the system. Nice huh?

That's really bad luck.

MD> After researching undelete tools I'm under the impression that I'm
MD> screwed because it doesn't know the cluster sizes for each file that
MD> is deleted. Is this correct?

These tools usually are good for recovering a single file or maybe a
folder with files that has been deleted accidently.

If you have deleted the whole partition, then it's really bad.

Things like start cluster and file size are not lost when you delete a
file, it's just the first character of it's name replaced by a special
"empty" character. The problem is the fragmentation of the partition. If
the file is split up into many parts spread over the partition, then it's
getting hard to find all of them, as this information gets lost when a
file is deleted.

You're lucky if your partition is not fragmented, then you will find it in
one piece.

Still you're lucky if you have only one or few files deleted. You can
check manually wether the freed data blocks on the partition belong to
this or that file.

But if all the files have been deleted then it takes a very very big
amount of work to reconstruct all the files. It is possible, but a very
very hard job, especially if there are many non-text-files on the
partition. These can hardly be related to different files.

BTW: all my words won't help you if your backup script deletes not via
GEMDOS routines but via writing blank sectors to your partition...

Regards,

Alexander

PS: You have a functional backup, right? Perhaps there are tools that can
improve recovery rate by knowing "old" versions of the files that got
lost...

I have a couple of STF's, mostly TOS 1.02, no modulator, but still usable if
you have a scart cable.

No, yes. Pin for pin compatible, one more possible instruction, and has
virtual memory support, which a ST or STe does not use, possibly runs a
few instructions a little faster.

Brag value, mostly.

Hi Alexander. What drive interface/software did you use to ge a 2.5" drive in your STe? I've got a Mega that I'd love to put an internal drive into.

Thanks.

>I got one of these recently - saved from a skip !
>
>Is it worth keeping / what can you do with them ?

I'd say it is worth keeping- it was a slim, esthetically pleasing design (for the time), had room for some expansion (the "megabus" slot inside, though there were few items made for it), and had an excellent keyboard (made by Cherry, with REAL switches). The ACSI (hard-disk) connector exists on the inside of the box as well, and a standard-dimensions hard disk can fit inside the box (but you will need ACSI-SCSI adaptor).

On the negative side, it had a DD floppy and a HD floppy can be installed only by a (relatively simple) hardware hack.

If you can find somewhere appropriate DRAM chips (maybe from old VGA cards?) and are skilfull in soldering, you can more-less easily expand it to 4MB- there are already places for additional chips on the motherboard.

>The old TOS isn't great either.

If you succeed in upgrading it to 4MB it becomes quite convenient to use RAM-loaded TOS 2.06. It will eat less than 300KB which is not that hard on 4MB of memory- and much better than TOS 1.2 or 1.4.

>Any advice about what to do with these things ?

It depends... what do one use an Atari for these days? Generally, it is the pleasure of having and using an 'oldtimer' machine. Beside that, e.g. I have a 4MB MegaST. I use it for email, ftp, writing, programming (Tera Desktop is currently developed on it), etc.

The ones I've seen for it are in a box about the same size as the one
housing the computer so sits neatly above it. A big heavy lump apparently.

The Grove Online has risen from the ashes of the early 1990s and been reborn in emulation. It's the first-ever telnettable Atari ST BBS.

Some of you may have heard about it... It's been in operation a couple years now. It still boggles my mind that this is POSSIBLE!

The Grove Online runs BBS Express! software and has tons of games available, including Assassin, Galactic Empire, Final Frontier, and many more.

Josh, is there somewhere that a former BBS Express! sysop can find info
about this? I used to sysop "The DarkForce! BBS" from about '92 thru '97.
We had about 200 active to semi-active users, with callers from around the
US and occasionally the world.

The layouts and parts lists are in the ZIP files with the software. I built
my own,
but I did get some one else to make the PCB's. The trick is to use ribon
cable
instead of seperate links.

Actually, that connects me to a freebsd login ;-) Maybe you need to
specify a port number for us to connect to.

Further, I was the proprietor of the very first telnettable Atari BBS
which was running Octopus BBS on an Atari TT030. And there are other
Atari related Telnet BBS's up and running, but not authentically running
on a real Atari.

The Atari-source.com BBS is down for now because Octopus is stilll under
development but I intend to bring it back up when I can more properly
configure it.

It was more a proof of concept and an educational experience in porting an
established BBS package to function as a telnet server.

Just like to set the record straight ;-)

4509. CT60 heatsink/cpu fan

Newsgroup: comp.sys.atari.st
Date: 2004-08-28 17:52:17 UTC
From: sf0218@aol.com
Message-ID: <20040828135217.06753.00003751@mb-m13.aol.com>
Source record: 17403

Hello all,

I finally received my CT60!!!!!!!!! Yay!!!!!!!!!!!!!!!!!!! Now I'm nervous!!! :)

Anyhow, I look over the CT60 and the thing that really jumped out at me:

The fan was not attatched to the heatsink in any way, and both the heatsink and fan are pretty small.

I was wondering if I could attach a heatsink and fan from a pc's cpu. The fan I speaking of has a plug which attatches to one of the power leads from a psu. And both the heatsink and fan look as though they would entirely cover the CT60's cpu.

Or should I just ask Rodolphe about it?

Thanks,

Sam F.

AFAIK Roldophe uses fans that are the same size as 486 so you should be
able to replace it. But use the standard one, thats what its for. the
68060 isnt that hot really.

Simon

I just purchases a Wizztronics rack case for the Falcon 030 (can be used for the desktop, which is what I'm doing) at a special price of $99.00. They were regularly selling for $250.00, $525.00 with all accessories added. Very nice, high quality unit, solid anodized black. Anyways, the sales person made the comment that they had about 17 units left, and after that, they're gone.

Just thought I'd pass it along.

Wizztronics is located in the USA. Their website is at:

http://www.wizztronics.com/main.htm

If nothing else, they can get canibalized for custom chips: the MMU,
GLUE, SHIFTER, DMA and also some standard chips which have become hard to
find by now. At least some of them were socketed, and all ST-series machines
used the same chips- so you will have spare ones for the more useful MegaST.

Dont try to remove the heatsink off the chip. It is thermally glued. You might want to glue that fan on top of the heatsink, thats what I did - just used a bit of superglue gel. You wont be able to overclock it very much (I think 72 is the max) so you wont need a bigger hs/fan.

Load up the CT60 .cpx's and watch the temperature for a while. Probably wont go about 45 degrees (c not f).

Coda.

It's not supposed to be attached, it slides on from the side. Use what
he sent you, it's fine for now.

I also got one of these for my CT60. Very well made, and plenty of
room. Good deal for someone who dosn't want to mess with adapting for
a tower. Also looks cool, and different from your standard looking
tower.

Sam,

This configuration is something you may not want to adjust. Although for my overclocking needs this heatsink is inefficient, the PC one didn't help but actually hurt. This heatsink is not bad at all. Since you don't have the E141J mask 060, your processor really won't generate an awful lot of heat. These things ran without heatsinks in most applications. How Rodolphe sent it should be quite adequate. As for the fan, mine seems to stay in place for the most part, and the fan Rodolphe sent is of a much higher quality than most out there.

So, how do I attach the fan to the heatsink? Keeping in mind, the heatsink/fan on my CT60 is not the same as the combo I've seen on the majority of CT60 photos, to include the photo on Rodolphe's website.

If it's not the same, then I guess you're on your own. Rodolphe should be
able to offer some advice. It should fasten with either screws through
the heatsink itself or plastic straps that hook onto slots onto the
heatsink.

Thanks,
Mark

Hi,

I just got hold of a book called "Learning C - Programming graphics on the AMIGA and ATARI ST" by Marc B. Sugiyama and Christopher D. Metcalf, published by Compute.

In the back of the book there was a order form for a disk containing all the source code in the book and compiled versions of all progs. Does anybody out there have this disk? If so can I have it? Or a copy or image file of it?

Anyone?

Hi Sam,

Wellcome to the CT60 owners :)

> So, how do I attach the fan to the heatsink? Keeping in mind, the heatsink/fan
> on my CT60 is not the same as the combo I've seen on the majority of CT60
> photos, to include the photo on Rodolphe's website.

So, you already found Rodolphe's website? Good. Then take a look at:
http://www.czuba-tech.com/CT60/english/Fitt_nosold.htm

It contains the remark/solution to your problems:
> There is no system to fix the fan on the heatsink. I suggest you
> to use a double side adhesive ruban between one border of the fan
> and the SDRAM DIMM or simply glue the fan on the heatsink.

Further I received some time ago an email from Rodolphe which "highlighted" this change of concept.

But I'm also interested in some pictures from other "2nd batch CT60 owners" who glued the fan on the
heatsink.

Philipp

Are you sure? I couldn't find very many pictures of *anything* at
their site. Definitely none of the rack case that I could find. There
doesn't seem to be a full catalog page, just a couple links to a few
items. Those links just offer worded descriptions of these items and
no pictures with very few exceptions. Could you give an exact URL of
the page the picture is on? Thanks!

>I've set on my CT060 for about a year now waiting for a NOVA fix.
>Haven't seen any post as of late about compatibility. Has anyone
>figured out if it's hardware or a software glitch?

It's only the driver (NOVA-VDI) that causes the problems. The hardware is
O.K. if you have the connectors to place it UNDER the CT60. In 030-mode the
NOVA works perfectly.

>I know Frank was given the source, but don't think he's figured it out as of
>yet.

Unfortunately I have neither the time nor the knowledge to fix it (soon). But
if there would be someone to do some beta tests I could give a contact
address of a programmer who would like to help. Unfortunately this friendly
guy doesn't have a NOVA or a CT60 so it would take some time for the
one who wants to help testing. :-)

>On the other hand, without Apex working, I'm not inspired to run it
>using only Videl modes. Picky bastard, I know:)

Sorry to tell you but AFAIK Apex doesn't work on the NOVA.

Well, it goes something like this... you try out all things Atari, and
eventually you narrow it down. I've done just that, and over time I have
narrowed it down to the Jaguar and Atari 800. :)

Currently have my ST stuff for sale. I have a 1040STE, works great, needs
floppy drive, and soon a box of ST stuff. :)

Just narrowing down to focus on what I like.

Thanks for responding Mike. I use a Hewlett Packard LaserJet 6L. I'm not
sure if Timeworks DTP is compatible. DTP uses GDOS. When I install DTP the
latest driver is for an HP II. When I run the .prg after installing for
font width, it crashes. I'd like to get it so I can use my HP 6L. Maybe
the latest version. Thanx! ===Ben===

The best place is on the messagebase of the BBS itself... The sysop there
wrote his own code to connect the Atari in emulation to the telnet port of
his unix box.

BTW - I neglected to mention in my original message that at the login
prompt, you need to type "bbs" which will invoke the BBS.

My mistake... Use the same telnet address, but login as "bbs" at the prompt.

Ah... Well, then surely The Grove Online qualifies as the first "Atari
telnet BBS running in emulation." :)

Can't get it to work :o(

Tried some HD drives and they wouldn't work either.
One of the old DD drives has some other switches. Anyone know what these
should be set to for the ST ?

What you need is the FontWidth program from an earlier version grafted onto
your current setup. The problem is with Fotwidth and the resulting tables,
not with publisher.

I had Timeworks working with NVDI 5 and using TTF's as well as SPD fonts
spewing forth from a LaserJet 5L.

I'd think so...
Gribnif products are no longer 'developed'...but as far as I know Dan still sells and supports them in term of documentation, media defects, etc...

Not long ago I wrote Dan Wilga about using Geneva/NeoDesk with an extended memory card for the Mega 4 and he responded in short order (6/28/04 he replied).

Here is the address I used: gribnif@pair.com

Maybe he's just outta home/town for a bit?

4569. Analogue Synth Emulation

Newsgroup: comp.sys.atari.st
Date: 2004-09-02 20:59:19 UTC
From: Crackers <bcracknell@sympatico.ca>
Message-ID: <vHLZc.25936$7i2.948796@news20.bellglobal.com>
Source record: 17363

Some time ago I downloaded an Analogue Synthesizer Emulator off the internet for the Atari ST that let it work like a MIDI synth module. It was fun to play around with but saddly it suffered such terrible lag that it was useless as an actual instrument. I think it was made by some company called Two Cows or something. It was definetly on the right idea though.

I was just wondering if anyone has come out with anything improved for the old Atari ST in the meanwhile. I've got about a half dozen old Atari 1040STs here (I always pick them up when I see them in the thrift stores for less than $10 because I know parts won't last forever). It would be kind of neat to hook them up and do an all Atari ST composition.

Incidently, does anyone know if turning off the graphics chip on the Atari ST improves the sound quality the same way it did when you turned the graphics chip off on the Commodore 64? That might be a handy thing to have.

Do the joystick ports on the Atari ST have analogue inputs to read paddles? You could hook up a set of old Atari 2600 paddles to the joystick port and use them to control different synth parametres in real time.

Any other software that lets you use the Atari ST as a MIDI musical instrument? Just curious.

Yeah, Twocows did the 303 and 909 and some stuff like that. They
soft-synthed roland instruments.

For the 1040, sadly I can say with at least 50% sureness that nothing new
has come out. Unfortunately the ST just doesn't have a lot of use as a
soft synth, but a MIDI connection to the YM soundchip could be cool in
most studios.

What is out is something called ACE Midi which is a glorious soft-synth
for the falcon that replicates most of the features found in a program
like Rebirth for windows or Reborn for linux on the soft-synth side.

But rather than having built in tracking, etc, it uses MIDI.

This is for falcon only and doesn't work properly with a CT60 falcon yet.
It costs something like $75 (I can't remember what I paid for it), but
it's NICE and it's a great way to use a falcon in a studio. The shame is
that you need to have some sort of D2D recorder... i.e. a second falcon

;-) or in my case, a Soundblaster Audigy 2 ZS Platinum on a PC. That has much better sound quality than a falcon anyway and incredible 108db SNR.

As far as MIDI tools for the ST. They are NUMEROUS but most not new. Check out http://tamw.atari-users.net. Tim's Atari MIDI World is by far the best place to look for atari midi info!

Thanks,
Mark

Yeah, Tim's Atari Midi World is an excellent website. I've been using it for
years. I still use a Mega ST 2 as my main MIDI workhorse.

There is tracker version as well. Support less channels as it need some
cpu time for tracker part etc, but it runs nice. And afaik it is free.

The Shifter cannot be disabled and it wouldn't improve sound quality
either. The YM soundchip is poor in sound quality.
The MIDI subsystem is fully independant as well (well it's mainly a
special serial bus).

> Do the joystick ports on the Atari ST have analogue inputs to read paddles?

Afaik there are no analogue inputs on the joystick ports but a small
interface with an AD convertor could be connected to the ROM port.

Bonjour ï¿½ tous,

Ayant installï¿½ une CT60, je ne parviens plus ï¿½ imprimer le moindre
document. Sois le soft que j'utilise tente sans cesse d'imprimer
(script 5, Works, Amail) sois j'ai un message d'erreur comme quoi
l'imprimante ne rï¿½pond pas. Elle est pourtant allumï¿½e et connectï¿½e
correctement. NVDI 5.03 est prï¿½sent et j'ai choisi le mode d'impression
en avant plan (im vordergrund). Pour les paramï¿½tres de lancement de
NVDI, j'ai enlevï¿½ le Fastload et j'ai laissï¿½ le prg et la mem en tt-ram
(j'ai essayï¿½ en dï¿½sactivant ces options ï¿½galement, mais sans rï¿½sultat).
J'ai des soucis ï¿½galement lors de la lecture de fichiers sous Papyrus :
j'ai un message d'erreur bus lors de l'acces ï¿½ la vdi nï¿½1. Le message
m'informe qu'il est possible que cela vienne de ma config vdi, tos ou
systeme mais aprï¿½s verif, je ne vois pas d'oï¿½ cela peut venir... Enfin,
il m'est impossible de faire les tests en mode 030 pur : mon disque dur
n'est plus reconnu dans ce mode et je ne sais pas pourquoi car en mode
turbo seul (sans ct60), CT 60 sans turbo ou CT60 avec turbo, tout passe
sauf le mode 030 sans turbo...

Voilï¿½, si vous avez une idï¿½e pour me dï¿½panner, un grand merci.

Par avance, merci pour vos rï¿½ponses :-)

@+,

Cyril.

Most excellent; well-done, sir! Looks like I'll have to settle for
second place -- I hope I can get it done soon, anyway.

I'm working on a telnettable multi-user version of a a citadel
program, based on an old version of Ganelius' Inner Sanctum. I have
the logins working correctly; I have just the message-entry part to do
and it'll be ready to go. (I still have all my old messages from
1996, when I finally took the modem version down. :))

I cant be specific with any numbers as I've not used Timeworks for years as it refused to work with my Graphics card so i can only talk from memory. I believe i used the fontwid from the earliest version of the current incarnation.

I could probably find it and email it depending on its size and your level of desperation.

A google search may also help as i discussed this at length some years ago.

Sam,

Any good computer store has them but they are hard to find. Sometimes
they are a plastic block with a 2.5" connector on one side and 3.5" on the
other side, and sometimes they are a little circuit board thinger. If you
have a Microcenter near you, they have them. Also mom and pop style
computer stores tend to have them. PS: If you run upon really tough luck,
I have an extra one I'll likely never use in this lifetime that you can
have ;-)

Thanks,
Mark

Sam, Wizztronics sells a little board that allows the use of 3.5" IDE drives if you'd rather go that route - then you can use the original 2.5" drive along with a 3.5" drive, or 2 3.5" drives. It costs something like $39.95.

BTW, its plug and play, no soldering - plugs into the Falcons original HD header.

Dear All,

Thank you for your help so far and sorry for not responding. I'm proud to announce, that a new atari user has joind to us: my baby was born on the 1st of September ;)))

Back to CT60: it seems my IDE problems have been solved. I now use a very very short IDE cable, with witch the data transfer is fine, but I absolutely don't know how to put the case together. Any idea?

SCSI data is still corrupt. Next I will try to replace the SDMA patch resistor to a bigger one.

I don't believe its a drop in and go option, i seem to recall some research that stated that some of the OS needs to be re-written as some of the 68000 instructions don't literally translate to 68010.

4595. [WEB] Eiffel 1.0.8 update

Newsgroup: comp.sys.atari.st
Date: 2004-09-05 13:21:34 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1gjnaac.it8lsm46xta8N%NOSPAMS@wanadoo.fr>
Source record: 17390

Hi,

There are a new version of Eiffel on my site:
http://aniplay.atari.org

These interface handle all PS/2 Keyboard and mouse:

* Keyboard with 102 or 105 keys and more with the set 2 (AT) or the set
3 (PS/2).
* Since v1.0.7 the keyboard can work without driver and you can build
your tables.
* Mouse up to 5 buttons.
* Mouse single and double wheel (IntelliMouse).
* Compatible with ALL Atari computers range (ST, STF, STE, MegaST,
MegaSTE, TT and Falcon).
* Two Atari standard joysticks support DB-9.
* Motor command for ventilator and temperature sensor.
* Near all IKBD supported (only IKBD_SET_MOUSE_THRESHOLD,
IKBD_SET_FIRE_BUTTON_MONITOR and IKBD_CONTROLLER_EXECUTE are not
supported).
* Updating eiffel capabilities from GEM application EIFFELCF.APP.

Eiffel firmware v1.0.8 update:

* The tables Shift and AltGr inside the flash (program memory) can be
used with 50 main characters of the set 2:
0x07 (F1), 0x0E, 0x0F (F2), 0x11, 0x12, 0x13 (><), 0x15 (AQ),
0x16 (1), 0x17 (F3), 0x1E (2), 0x1F (F4), 0x24 (E), 0x25 (4),
0x26 (3), 0x27 (F5), 0x2E (5), 0x2F (F6), 0x36 (6), 0x37 (F7),
0x39 (ALTGR), 0x3A (,M), 0x3D (7), 0x3E (8), 0x3F (F8), 0x41 (;,),
0x45 (0), 0x46 (9), 0x47 (F9), 0x49 (:.), 0x4A (!/), 0x4C (M;),
0x4E ()-), 0x4F (F10), 0x52 (ï¿½'), 0x53 (*\), 0x54 (^[), 0x55 (=),
0x56 (F11), 0x57 (PRTSCR), 0x59, 0x5B ($]), 0x5E (F12), 0x5F (SCROLL),

Is anyone familiar with using a Wacom tablet with MagiC, Nova drivers for the Nova card, NVDI etc.? I just connected one and it seems that after restarting my TT it gets into a loop. After deleting all the Wacom prg. files it gets back to normal but i am eager to get the tablet working....Any help on this one?

Thanks in advance,

Raoul Teulings

If you would have known how to use a search engine like Google, the
first hit for the search string "ultimate virus killer" would have
been:

www.uvk2000.com

On that site, you should be able to get contact information to the
author.

Hi All,

What's a fairly good atx psu to get for the CT60. I've got 2 atx psus but not a one has a power switch to it.

Thanks to all,

Sam F.

No atx psu's do. They use soft power switch. You get an ATX compatible
case (or hell even just a switch will do), and plug the ATX psu into the
ct60. Then the first set of pins on the little header beside the PSU plug
is CT60 power. Just put a little push button switch on there, click once
it turns on, cilck again it turns off. The reason behind this is so that
your computer can be smart and shut down before finally powering itself
off when you hit the power switch. Also can use power switch to set the
computer to sleep.

Thanks,
Mark

I think my old roomate wrote the driver for this, Noah Silva.
He had it working under MagiC on a TT030 specifically. I witnessed this.
Please check and see if the driver you have was written by him or someone
else.

Thanks,
Mark

No ATX PSU has a switch, as Mark has explained.

Enermax PSU's are stable and reliable, good for running many drives etc.
Zalman PSU's are wonderfully quiet. Should be good for a CT60.

Some ATX PSU have AC switch, some others have not !

You don't need an AC Switch ...
It is just more confortable to turn OFF when you leave home for a long
time..

Regards

Hallo Raoul,

RT>Is anyone familiar with using a Wacom tablet with MagiC,
I'm not too familiar with using it, but when I put ARTPAD.PRG into the AUTO folder and ARTPAD.ACC on my boot partition (e.g., root of C:), it works as it is to do.

I'm going to send you my XBOOT settings for use of the artpad by private mail. I hope it will help you a bit.

I find important to hook the artpad on the right jack, for my TT it's one of the slower ones (MODEM2 with 9.600 b/s), and the boot order of the AUTO folder...

Hummm
I have 2 systems (P4 2.4) and both of them have a on/off switch on the
power supply..altho it might be due to the cases themselves sitting in
a warehouse somewhere for ages before i got them.

Thomas

4611. Add your classic gaming or classic computer site to 8bitclassics.com Links!

Newsgroup: comp.sys.atari.st
Date: 2004-09-06 20:07:46 UTC
From: 8-Bit Classics <nospam@8bitclassics.com>
Message-ID: <lrgpj05qtmqb406s7ejfi5o557f9p0kqje@4ax.com>
Source record: 17305
Cross-posted to: comp.sys.amiga,comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.st

Do you have a classic gaming website? Would you like to move up higher on a Google or Yahoo search? Add your website to your Links page! Simple to do, just fill out the simple form and submit your link. I will review it to make sure it fits in at 8-Bit Classics. If it does, your link should be approved soon. On the form it does mention the requirement for cross linking 8bitclassics.com on your page someplace. This isn't a requirement, just something that would be appreciated :) Just fill in your normal URL if you won't be cross linking with 8-Bit Classics.

If I get many of a certain category (like Amiga, ST, or TI), I will create a new category for them and move them.

Go to: www.8bitclassics.com and click on the Links link on the bottom.

This is a valdi point, mine does have an AC switch on the back, but I
didn't even think about it because you're not supposed to use that for
general operations ;-)

Hi Petr,

I once tried the Debian installation (Woody I think) on the Milan060
from CD. The installer used to crash before getting very far. I think
I posted some questions on comp.os.linux.m68k it's too long ago to
remember the details off-hand.

Originally I had planned to try Linux on a new drive that I was installing
but I've now put normal GEM and Mint partitions on there :-)

4616. Vintage Computer Festival 7.0 - 11/06-11/07

Newsgroup: comp.sys.atari.st
Date: 2004-09-07 10:47:29 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <5lg%c.391056$%_6.145561@attbi_s01>
Source record: 17310

```
OK
ATDT19252945900
CONNECT 300

Connected to the VCF BBS...

Featuring 10 megz of k-rad computer history!

_____________________________________________________
| |
| : Vintage Computer Festival 7.0 : |
| |
| Saturday, November 6th through Sunday, November 7th |
| at the Computer History Museum |
| Mountain View, California |
| |
| http://www.vintage.org |
| |
|_____________________________________________________|

The 7th Annual Vintage Computer Festival comes at you this November
6th and 7th with the sights, sounds and smells of vintage computing!

Join us for another action packed extravaganza, featuring an exciting
lecture series, a diverse and vibrant exhibition, and a marketplace
brimming with vintage computers o' plenty!

[> Current Speaker Roster <]

Saturday, November 6

10:00AM => Fred Cohen: Using Vintage Computers in Computer Forensics
10:30AM => Jason Scott: Documenting the BBS
11:00AM => Christian Wirth: The Art of Textmode

Sunday, November 7

11:00AM => Nick Tredennick: Early Microprocessor Design
1:00PM => Andre' LaMothe: The XGameStation

* Many more speakers to be added soon; schedule subject to change

For more information on the speaker series, including abstracts and
speaker bios, visit:

http://www.vintage.org/2004/main/speaker.php

[> Special Events <]
```

o Beta screening of Jason Scott's BBS Documentary

Jason Scott has been working on a series of seven films that document the history of online bulletin board systems. This will be the first public screening of these films, and the feedback from the screening audience will help direct the final cuts. More information can be found here:

http://www.vintage.org/2004/main/screening.php

o Retro-Code Video Game Programming Challenge

Can you write a videogame on a vintage computer platform in three hours or less?

http://www.vintage.org/2004/main/retrocode.php

[> Vintage Computer Exhibition <]

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. Ribbons and prizes are awarded in six classes and eight special categories, including the coveted Best of Show and People's Choice awards.

For more information on participating as an exhibitor at VCF 7.0, visit:

http://www.vintage.org/2004/main/exhibit.php

[> Vintage Computer Marketplace <]

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. For more information, please visit:

http://www.vintage.org/2004/main/vendor.php

[> Spread the Word! <]

Download and post this gorgeous VCF 7.0 flyer on every flat surface in your immediate and extended sphere of existence!

4617. A port of a game to Lin&Win

Newsgroup: comp.sys.atari.st
Date: 2004-09-07 21:12:46 UTC
From: "Pavel J. Reznicek" <pavel.jindrich@tiscali.cz>
Message-ID: <chl811$10al$4@news.vol.cz>
Source record: 17311

Hi,

in the past I thought it would be cool to port a game for Atari ST to a PC version and to improve it a little bit.

A big company still owns the rights to the game; so there can be no success legally. Or do you have some clue how to do it?

Cigydd

Ah, I think you misunderstood me. In the 1980/90's there existed a
cartrdige and software for the ST. This allowed you to run a robot from
your ST. Simple enough really. Anyhow, I thought it would be cool to
plug the ST into the Tele and tinker with it. My 5yr old Daughter is
getting into lego atm(well I am again;-). I got 3 links in Amazon that
refer to this, and they are all books of course.

Well Ive listed a few more items on Ebay. I startd going thru my Atari Garage and realized I have alot of stuff I dont need. Everytime I buy a Atari System I for some reason save the software and never sell it or dispose of it. So I have a TON of original Atari Software that Ill be listing along with more hardware. So if you would like to have a look check it all out at:

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=atari_only&include=0&since=-1&sort=3&rows=50

Thanks, Don

Message-ID: <20040909085130.13013.00000308@mb-m21.aol.com>
Source record: 17321

I guess what I'm saying is that: I plugged the ct60 on to the falcon mb, Plugged the atx psu to the ct60 and one lead to the floppy drive, attached keyboard and monitor to the mb, and lastly, plugged the power cord to the psu and......nothing. So, I'm guessing that the psu didn't even turn on?

Thanks,

If you make a game that is similar to a copyrighted one, you will have
no ability to sell it. However, if you give it away you are probably
safe, as evidenced by the many Monopoly, Risk, and Sorry clones that
abound. Copyright only protects commercial activities.

If I may enquire, why is this board necessary? Since the IDE standard
allows for two drives, most PC/Mac setups appear just to have a cable
with two connectors.

Hi Galen,

it's interesting what you write. So you think it will be safe to make a
port when I give it out for free?

Let's call it a clone - with some changes and improvements.

Thanks for you idea. I don't mind that it wouldn't be for money.

Pavel

4632. Re: NOVA and CT060

Newsgroup: comp.sys.atari.st
Date: 2004-09-09 18:00:14 UTC
From: Frank_Szymanski@du3.ohse.de
Message-ID: <20040909200014.a7177@du3.maus.de>
Source record: 17328

>moin, moin

N'abend.

>I need to make those pins on the NOVA. Now it sits on top of Expose,
>on top of AB040. If the hardware is ok, I have BSS debug to step line
>by line execution of the NOVA VDI (if BSS Debug works on 060).

So you already have the sources. If not I can send them to you.

>Do you get to a white screen with the NOVA VDI in 060 mode?

Yes. But due to the fact that my NOVA is now back in my Afterburner equipped
falcon it may be that my memory is wrong at that point.

>Time is what we have owning a Falcon :) I will begin installation soon
>and contact you. Thanks!

If you like to contact me write to: frank DOT szymanski AT 12move DOT de. The
address above is not valid due to massive spamming. :-(

>>Sorry to tell you but AFAIK Apex doesn't work on the NOVA.
>That's ok, on AB040, Expose and NOVA, just turn off the NOVA with
>switch to use Apex and Falcon Tripod for capture and editing, then use

Although I have an afterburner switch ;-) for switching between 030 and 040
mode (it was little bit tricky to install) I don't have a switch for
NOVA/Videl.

>other applications on NOVA for viewing or editing. Chronos, Phoenix,
>Photoline, NeoN. But if Apex only runs in 030 mode on CT060, then best
>to keep one Falcon an AB040 or Mighty Sonic 32.

I don't know whether it runs in 060 mode or not. But you are right. Until
there is a SuperVidel I still run two falcons on a regular basis. The main
falcon is an afterburner/NOVA computer while the other one with ct60 is more
experimental :-)

Dennis Vermeire left us forever.
Thanks to Martin to have kept me aware today.
Though I didn't come anymore on the forum I had some very long phone discussions with him but I never met him. He was living in Gand (Gent) in Belgium.
Dennis certainly was a passionnate atari user and I can't imagine this forum without him ....
Yes, I was coming from time to time to read his posts ...

Take your breath Dennis, not everything is finished
Keep the lightway

I won't forget you

Hmm, don't know - will a stock Falcon support a combination of a 2.5"
drive and a 3.5" drive, or 2 3.5" drives by itself, just using a cable? I
guess thats the question.

Sad news indeed. He is in my thoughts and prayers.

Does anyone know if he had been ailing of late? I find myself at a loss as far as particulars about Dennis.

He has been such a fixture here that I had been content with his posts and never realized that I knew next to nothing about him. I'm not going to punk out and say that I always agreed with him, but he was an Atari user, and that's enough for me. The correspondence I'd had with him had been cordial and good-natured.

If anyone out there is able to fill in some of the blanks about Dennis, please do so for the benefit of the rest of us.

Thoughts and prayers,

Joe Mirando

Hello,

sad news indeed. He brightened up convo's here to say the least,
whether or not one agreed with him. I surely hope he took one of his
favorite machines with him up there!

Very sad to hear this news, not always agreed with some of his comments and views, but often found myself concurring, and at the end of the day he was an Atari user with knowledge.

He's going to be missed for sure.

Hi there!

2.5" and 3.5" IDE have the same signals. Only that 2.5" IDE has power integrated within the ribbon cable. So all you need is an adaptor between both sizes. This can be implemented as some kind of plug or as a small PCB.

Regards,

Alexander

Dennis will be remembered for his friendship, his untiring work in furthering the Atari cause, and for being the instigator of first D&D and later DDP Translations, responsible for bringing many German (and some other languages) applications to a much wider English-speaking audience.

He will be badly missed.

Great CPU! Increases overall performance by 1-3%, with especially coded 68x10 software even more. There were some bytes of cache in the instruction area, as I know.

I have used such a CPU for gaming, instead of the 68000 and I have not found any unsimilarities. The 68010 is the same... in my opinion. The 68020 is totally other!

I dont know if the 68010 is making any instabilities in ST/TT Software. You have to try out. Timing related code could work wrong! As the CPU is faster than a 68000.

Best Regards,

Daniel Mandic

Vintage Home Computers for Sale

Because I am moving to Europe, I am currently selling off my entire vintage home computer collection. All items are from my personal collection and have been professionally cleaned and restored unless otherwise specified. I have spent many hours working on my vintage computers taking them apart and cleaning every single piece of them. I have even cleaned each key of the keyboard individually.

My entire collection can be viewed at:

http://www.vintagehomecomputers.com

The photographs on the site are photos of the actual items for sale.

All items are located in Atlanta, GA and are available for local pickup or shipment anywhere in the world (except for those really heavy ones).

If you like a particular computer and would like to make a resonable offer, please e-mail me with the link to that machine and the price you are offering to pay.

I can accept PayPal, Checks and Money Orders.

Regards,

Krystian (at) hexlabs (dot) com

Yes me too - he has done a hell of a lot for the Atari community
and was always ready to help people with problems. Not to mention
his work with first DD and then DDP Translations.

Although I never met him in person, we corresponded a lot and I'll
miss him a lot. May he rest in peace!

Guys, I remember Dennis from way back before I left for awhile. Just out of curiosity, how old was he and what was the cause of death?

Sometimes I sit and read some of the older Atari mags that I still have and I see names that I used to converse with almost daily, and now...now I wonder where and how they are. Its sad sometimes...

PS There should be some wise, sage saying about old Atarians... :-)

Sounds like you have made changes in the AUTO folder. STiK will not work
with EtherNEC AFAIK?

Check if you have STING.PRX in your AUTO folder. If you are lucky all you
have to do is rename it to STING.PRG. If not you have to install STING
and configure it to use EtherNEC.

ah sorry, I ment to say STING! I've used it before but its just stoped
working, ive not changed anything on the falcon, so its like its a PC
problem..... I'm using Atari FTP 1.09, ive used that before with no
problems, but it just records in the log that user XXXX was logged out, and
on the PC I get access denied... they are connected but Atari FTP wont let
me logon, ive tried everything, its such a simple setup aswell :-\

This is to all CT60 owners:

I still have my falcon in the bottom half of it's case. I don't have the hardware yet to move the mb to the AT tower server case I have.

I installed the ct60 on the mb. I connected the falcon's floppy power lead to the ct60, being mindful of the color orientation, I plugged a dell atx psu to the ct60. I plugged a power lead from the psu to the floppy drive. I placed a boot floppy in the drive, and plugged in the ac power cable to the psu and......nothing, zero, zip nada.

What did I do wrong? AFAIK, I hooked everything up according to Rodolphe's NO Solders instructions.

Help!!!!!

Sam,

I'm assuming you also installed an on/off momentary switch to turn on
the CT60/Power supply (atx power switch)?

hi!

I think exactly the same!
Just take a screw, simple contact
between the switch and you're ready for turbo test!

After, just plug an atx switch on front side!

Bye

Source record: 17167

dear Atarians,

Some of us had been looking for Dennis for quite some time now but
apparently weren't close enough to his private life...

I really hope it hadn't ended the way of a friend of mine.

We were calling each other by phone every other day, then the
summer holidays started... I came back after 4 weeks and made
a phone call - nobody in - the next day the same signal, after
3 days the frightening signal that the telephone had been locked
off. By then I knew something terrible had happened. I phoned
City Hall - nobody was authorised to tell my anything. Me being
no relative can't be given private information. My friend was
a near heremite, no family I knew of, just his hobby and a few
cats were his life... The Police Dept. eventually gave me the story.
My friend had died 3 weeks earlier just be himself. The neighbour
woman had notified the police that she hadn't seen him for a week
coming out of his appartment. When they found him he had been
dead for more than a week. The place was a mess. The police gave me
an address of one of his sisters, who I then got in contact with.
They had no idea their brother had had such meaningful hobby with
so many friends all around the country...

All I could do for him was to write an 'In memoriam' and put it
on the web with the only photograph of him I happened to have made.

groetjes, Rein

The floppy drive should be powered by the ATX PSU.

The floppy drive power cable that connects to the falcon's motherboard
will now plug into the port on the side of the CT60. Your falcon probably
isn't getting power! ;-) If this is connected right, then you simply
aren't turning it on...

If the fan to your atx psu isn't turning on when you
plug it in, then you don't have one of the auto-on types PSU, you need
to plug a jumper onto the ct60 power pins (or a proper switch).
You only plug it on for a second, not leave it on there. It's
a momentary switch versus one that holds the connection.

You could use a screw driver or a razor blade to carefully connect
those two pins momentarily to get it to switch on. Look on the
installation page to make sure you are jumpering the right pins.
DON'T do the wrong ones! The pins are the first two on the long line
of pins that sits beside the ATX PSU connector. it's a single row
of pins, not one of the double rows. And the 2 pins are the furthest
away from the psu connector.

Whatever you do, use extreme caution, no need in frying this board
as soon as you get it. Heck I already dropped mine and had to repair
it ;-)

Sam,

If your drives are connected as before, but with the new ATX power
leads your system should boot exactly as before. The only difference
with the CT60 on is you will see the CT60 color splash screen, and
then a white screen that will show you the speed of your CPU, whether
TOS is copied to RAM, boot version, amount of SDRAM, etc. What are
you seeing on the screen? Are you getting a GEM desktop eventually?
Does the light come on on your floppy drive when booting?

The rommix utility that comes with Pinatubo does exactly that (and more) -
sanmple scripts for splitting TOS into 2 or 6 eproms are also in the
archive.

I'm assuming that you have all of those drives plugged into ATX PSU. If you don't, do that now ;-). Otherwise I'd say the problem is likely that you need HD-Driver. I think that's one of those gotcha's with the CT60 nobody really talks about, is that HD-Driver 8.1 is recommended for best operation. I remember when I first got mine, my floppy didn't work but it was because I got one of the first run CT60's that was not updated. You have a much later one and it should be running the latest firmware. Ask Rodolphe.

Thanks,
Mark

Mark,

So I just need to boot with a floppy containing hddriver.exe or whatever the file name is?

My son got hddriver 8.1 for my birthday last year, but I was holding off from using it until I got the CT60... :)

Thanks,

Hi Rob,

Thanks!!! I did get the Mint cd....haven't even tried yet....waiting to get the Falcon ready with the ct60 and then re-case the thing. Sad to say that I haven't made much progress on the re-casing bit. I still need to get the hardware to extend the ports, and the mb standoffs.
BTW,,,does the ct60 have any onboard drive? I've notice that it has 2 50pin headers....what are those for?

Oh yeah, the power thing is set for now, until I implement a more permanent method.

Thanks

Power on Falcon and peripherals ?

See TOS desktop ?

Boot from IDE HDD ???
If not, install boot from HD driver in 030 mode (!) !
And install too the CT60 CPX and Xcontrol software and the NVDI 5.

After that the boot from HDD should be ok up to desktop !

Booting from a floppy drive in 060 mode is not a good idea !

Regards

Well that's kind of silly. HD-Driver is quite beneficial even on a
plain ST ;-) Let alone a normal falcon. Follow the instructions that
Rodolphe gave you in the later thread, that's about what you
want to try.

Those 2 50 pin headers are CT60 bus headers. For upgrades that tie
directly to the 060 bus. So upgrades that hook on there will be quite
fast compared to upgrades that plug onto the falcon bus. No IDE support
in the CT60. Some devices that are being worked on should solve that
issue. Man I would love to have ATA133 IDE hooked up to the 060 bus ;-)

It is possible to burn the auto program portion (boot strap) of MagiC, and some of the MagiC.IMG into ROM...but most of it still runs from disk. Your AES, Desktop, VDI, GDOS, etc....it's all gotta be on disk anyway.

A Drawback to this is you can't get your old TOS/GEM back unless you've piggy backed ROMS with a switch somehow.

In my experience it's really not worth it to burn MagiC to ROM.
You will not reclaim much if any memory...
You'll still need a system disk with the magic image and supporting files....

If you're trying to run a system with no hard disk...stick with single tos, or a bare bones Geneva setup that gives you a healthy sized RAM disk.

>me logon, ive tried everything, its such a simple setup aswell :-\

1. Launch the STinG Dialer and try to ping 127.0.0.1 to check if STinG is
running OK.

If not, reconfigure STinG.

2. On the pc Ping a known working IP address.

If OK then

3. Try to ping the Atari IP address from the pc.

If OK then

4. Try to ping the the pc IP address from the STinG Dialer.

If step 4 fails there might be a firewall running on the pc that blocks
ping.

Even if ping gets through ftp access may well be blocked by a pc firewall.

If you use an ftp client on the Atari side you could try to run a ftp
server instead. But "1.09" sounds like you already are? A pc firewall
would not block outbound ftp transfers.

If step 3 fail check the lights on the EterNEC etc...

Message-ID: <41455cb9$0$20244$cc9e4d1f@news-text.dial.pipex.com>
Source record: 17189

Hi all,

I have a problem with my falcon that I can do any file copy transfer from floppy to HD or any other combination you can think of.... BUT.... when I copy a folder from my HD to floppy I get 2 bombs everytime. It seems mad that any other file copy will work fine.......

HD - HD file copy OK
HD - HD folder copy OK
Floppy to HD file copy OK
Floppy to HD folder copy OK
HD to floppy file copy OK
HD to floppy folder copy FAIL! 2 bombs.
Floppy to Floppy file copy OK
Floppy to floppy folder copy OK

Can anyone with a falcon verify these who is using HD8 ? I've asked Uwe and as far as he knows HD is fine. Im using internal IDE drive.

Hi Chris,
by mega STOS demo do you just mean a large demo or a demo for the Mega
STe?

I may be able to help but am busy producing hardware for the Atari
Jaguar and so all my efforts are focused on this at the moment thus I
am unsure of how much time I can put into this and when. If there is
no timescale involved then I might be able to get something started,
but probably won't be able to give it proper attention until the
begining of next year.

Not being very good at drawing I have not really done any sprite work
and therefore I don't use the Misty or Missing link extensions but I
do have the Cyber extension and STOS Meastro (with sampling
cartridge). Most of the programs I have been writing so far are
applications although I am working on a STOS 3D game.

I wonder how many replies you will get and how that relates to the
number of STOS users that are still out there?

Well so far I dont think there is any STOS users out there anymore ?? we'll
probably end up doing it all on our own "as usual", though it would be nice
to have some of the old STOS coders involved, make it a STOS demo to
remember!

The MEGA demo is for the ST, a STOS MEGA DEMO, Myself and others used to run
"MEGA Diskzine" so were thinking of using up all our "left over" STOS code
and producing one last STOS MEGA DEMO.

were mostely thinking of writing it under STeem so it will be 100% compatiable..... though some things like scrollers dont work well under Steem so a real ST would be needed for best effect...

I never got the hang of STOS 3D, TBH I think the package is bloody awefull to use, I think I did use some STOS 3D stuff on the first issue of MEGA...

i''ve setup a FTP with the STOS setup we will be using, and all the code for swaps and tests will be there. its not a public FTP so only demo coders get access to it.

I dont know how long the demo will take, probably a few months... though I can't spend a great amount of time on it, so I will be coding my stuff up over the next couple of weeks, then just a matter of waiting for conributions etc......

Got a reasonable HD based system (4mb RAM, 30mb hard drive but
planning on a 130mb one to go in it before the OS upgrade) currently
running TOS 2.06. Sounds like it's not wroth it to me either, do you
know round about how much HD space MagiC takes???

4698. CTLink : status

Newsgroup: comp.sys.atari.st
Date: 2004-09-13 10:50:39 UTC
From: Rodolphe Czuba <rod-yenamarreduspam-olphe.czuba@free.fr>
Message-ID: <41457b7b$0$24259$626a14ce@news.free.fr>
Source record: 17193

Up to this day, I received only 40 registrations for Falcon version and 25
for VME version (for MSTE, TT & HADES !). About TT, don't talk me more about
an important number of TT users : it's false !
And some people did a registration for 2 or 3 boards !
In fact I received registrations from 32 and 16 people, respectively for F30
& VME versions...

It is really not enough to produce the boards !
I will not finish the boards (PCB routing) !

In the worst case, the design will be FREE on my web site.
Or I finish the board for Falcon only and produce it for 2 or 3 serious
developpers that will design some USB software/drivers for a future
machine...
But because the EtherNAT board will be available for CT60 and because the
better developers have a CT60, it seems there is no good reason to finish
the board...

Hello!
I want to buy Atari 1040 ST from one man... Hi told me that it is a computer with monitor.
And he has no disks for it.
So it is unusable now.

Few questions:
1. Is Atari 1040 ST use standart 3.5" floppies like any PC???
2. If I buy the computer, where I can find OS disk image and another disk images with useful utilities, programs, editors, and of course games?
3. How can I write this images to disks with PC(both under Linux and windoze)?
4. How can I read with PC files that are made with Atari ST (for example text files)
5. I had hear about con-tiki OS port for Atari ST, but link from con-tiki page follow to the german page... I can't read german and I didn't understand ...
6. What languages are available for programming on Atari ST? Are there Pascal?
7. Can I connect Atari ST to my PC via serial link or to tcp/ip network via modem or ethernet???
Thank You very much.

This is the most shocking news of the past years to receive. I've known Dennis as one -if not he most- dedicated Atariusers on this planet. There wasn't a problem concerning our beloved machines that he could not solve or help you on the way. In the course of time and through our in-depth correspondence there was also interest in the everyday things, personal or not. Although we never met (the intention was to see each other in my living town this summer) he was a personna for me, a friend if one would call a very loyal and helpful person like that. Each time i start the Atari after receiving this terrible news there's a void and something's missing. It'll take time to get over this emptiness. I will miss Dennis a lot.....

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 1 x Stacy, 1 x Stacy4, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx, 2 x SLM804, 1 x SLM 605.

1. Yes
2. It isn't all freeware, so try the internet (file-sharing) and find
people who can help.
3. With the right software.
4. From floppy.
5. ?
6. Pascal, many Basic's, C and probably many more.
7. Serial probably quite easy, ethernet isn't standard on Atari1040ST,
but try to find a solution.

: Hello!
: I want to buy Atari 1040 ST from one man... Hi told me that it is a
: computer with monitor.
: And he has no disks for it.
: So it is unusable now.

: Few questions:
: 1. Is Atari 1040 ST use standart 3.5" floppies like any PC???

Yes, but only 720 K, not the high density. The Atari floppy uses almost the same FAT format as a PC, so the contents can be shared by dos/windows, linux (as FAT) and the atari, _but_ to share with dos/windows you need to format the floppy disks on the dos/windows system, not on the atari. This is only an issue if you need to read from an old atari disk, because otherwise you simply format them on dos first, and then they work on either system. (If you do need to read old atari floppy disks on a PC, then what I do is boot into linux - it reads the atari disk with no problem.)

: 2. If I buy the computer, where I can find OS disk image

the OS is built into ROM, so you don't ever need an os boot disk.

and another
: disk images with useful utilities, programs, editors, and of course
: games?

google for atari st, lots and lots of stuff is available for free, and lots of non-free software is also available (sometimes second hand, sometimes simply still available from the author, shareware etc).

: 3. How can I write this images to disks with PC(both under Linux and
: windoze)?

"images" could mean several things. In general though, you format a floppy on dos at 720 K, and then copy your files onto it. The atari will be able to read them.

However, programs won't run unles they are atari programs, cause the atari uses completely different cpu than the pc.

Linux reads/writes the atari disk with no problem, simply mount them using the fat type (mount -t fat I think, but "man mount" to be sure of the syntax and keywords).

: 4. How can I read with PC files that are made with Atari ST (for
: example text files)

text files are identical to dos text files. Note however that when using accented characters, the atari uses the same character set as the original dos defaults. So if you read/write these characters on the PC then you need to select the correct character set or the accented characters won't be correct when you share the files. (On my computer, the EDIT command under dos sees the correct characters, whereas the NOTEPAD program under windows sees the wrong characters, so I typically use a dos editor to edit atari files on my pc).

: 5. I had hear about con-tiki OS port for Atari ST, but link from
: con-tiki page follow to the german page... I can't read german and I
: didn't understand ...

con-tiki ? sorry never heard of it,

: 6. What languages are available for programming on Atari ST? Are there
: Pascal?

yes, in fact I think I saw a link to prospero pascal for free the other day, though I could be wrong. Various compilers in C and pascal were available, but I don't know off hand where to get them. Other things are/were also available, I'm sure that google could find them.

: 7. Can I connect Atari ST to my PC via serial link

yes, the atari serial port is a standard port like on a pc. A null modem cable will allow the atari to talk directly to the pc's serial port, you just need the right software for this to be useful. I used to use a version of kermit to copy files to a macintosh (which also has the same standard serial port), and have also used a terminal emulator on the atari to use it as a terminal plugged into a pc runing linux.

: network via modem or ethernet???

people talk about this, but I don't know any details. Atari ST has no direct support for ethernet.

Think of games like FreeCiv. You can't use the artwork, or coding, or
other things that aren't your creation. However, your gameplay may be
similar (or practically identical) provided that you are not selling
it. I'm not a lawyer, but the idea behind copyright (at least in the
US) deals with "commercial harm". If you are not competing with the
guys with the commercial rights then I believe that copyright is not
an issue.

I'm affraid not, maybe someone else has got them to run, I think sometime is unstable somewhere, sometimes ghostlink will run in CT60 mode, but often not, at the moment its running fine..... im actually beginning to wonder if the overlclock of the 060 is a bit too much, maybe 50mhz would work better... I may get a oscilator and try it actually.

STOS has made progress and comes up with "illigal instruction" , most times I get "access fault" and a register dump of the CT60....

why do you think I am joking ??

ive been trying to get it all to work for months! I'm supprised Rololphe is still replying to my E-mails ;-)

It seems that perhaps you have an old version of HDDriver? If I
recall, the older versions did not work with the CT60.

Go back to 030 mode and tell us what's in your auto folder.

Don;t need any disk OS is in ROM.

> So it is unusable now.
>

No

> Few questions:
> 1. Is Atari 1040 ST use standart 3.5" floppies like any PC???

All ST's MegaST and STE are single density, so 720K max,
(TT, Mega STE, Falcon have HD)
Some of the older STs had single sided drive so 360K max.
Older ST does not format (quite) ST compatible and newer
Windoze won't format 720K disks.

> 2. If I buy the computer, where I can find OS disk image and another
> disk images with useful utilities, programs, editors, and of course
> games?

Plenty of places still have Atari software.

> 3. How can I write this images to disks with PC(both under Linux and
> windoze)?

Providing ST has 720K Double Sided drive just format and write on PC
ST will read.

> 4. How can I read with PC files that are made with Atari ST (for
> example text files)

Plain text is same format.

> 5. I had hear about con-tiki OS port for Atari ST, but link from

Somewhere. Never used PASCAL.

> 7. Can I connect Atari ST to my PC via serial link or to tcp/ip
> network via modem or ethernet???

Serial on ST tends to be slow, and if it has no hard drive then just use
floppies.
Look also at PARCP

I can't answer the question you asked, since I only run MagicMac (not
Magic-Atari), but Geneva/Neodesk allows for a bit over 2MB of ram free
on a 4 MB system with all the bells and whistles turned on and
surprisingly takes just over 1MB of HD space. (Of course, you can make
your CD, printer, or font caches take up more RAM if you wish! ;->).
I suspect the RAM and HD requirements of Magic are somewhat higher,
but probably not a huge amount higher.

Source record: 17264

Rodolphe,

I would take 2 of each if the cost was around 75-80 euros. Otherwise
you can put me down for 1 of each at least. I have 2 Falcons and 2
TTs, both need a network card.

<soapbox>
A lot of effort has gone into this project, and its up to the Atarians
to belly up, get one while you can, otherwise have wait until another
person can step and produce or take over such a product.

I still like and use my Ataris every day. Its unfortunate that its
basically too little too late. Most people have either sold or put
their Atari in storage, because they now have a Mac or PC that has
this function built in for about $5. These would have sold extremely
well in the 90's.

Putting the design on the webpage may influence somebody to pick up
the torch where it lies... Many of us would like to do that, but some
are still trying to figure which end of the hot soldering iron to pick
up. Most of us do not have the faculties nor the resources to learn
PCB part placement and routing.

The only way that I can see this working is to pre-pay 100-125 euro
and either get refund/free shipping or pay an additional amount when
the run is completed if it is more than 100-125 euro...

You have to ask yourself, this may be the only chance of getting a
network card with usb ports for the Atari...
</soapbox>

Thanks for your time & bandwidth
Rory

Yes. However, most STs use DD floppies, not HD floppies. DD floppies
are a bit harder to find, but it's not difficult to order them. Just
do a web search under "DD/DS". (One such place that I've used is
Viking at
http://www.vikingop.com/(ty31qqaaksbowiaoteq4fv55)/catalogSku.aspx?ID=SP12882&xref1=SDTRAF
).

> 2. If I buy the computer, where I can find OS disk image and another
> disk images with useful utilities, programs, editors, and of course
> games?
Unless the Atari is a VERY early model, the OS is onboard. Turn on
the computer and wait 30 seconds. As for useful utilities, programs,
etc., there have been a number of CDs made in the past. The only
current FTP site is fortunately a good one. Try
ftp://chapelie.rma.ac.be/atari/ for all your freely available Atari
needs. As for commercial programs, there are a few vendors left such
as Atari Workshop (http://www.atari-workshop.co.uk/). It is possible
to do most things with freely distributable software.

> 3. How can I write this images to disks with PC(both under Linux and
> windoze)?
Rather than type the entire process here, I'll refer you to the
emulator STeem (for PC and Linux) which has a very good set of
instructions. See http://steem.atari.st/beginners.htm

> 4. How can I read with PC files that are made with Atari ST (for
> example text files).
Put your floppy in the PC and double-click! (It helps to use
preformatted floppies or to format using Win95 or 98.

> 5. I had hear about con-tiki OS port for Atari ST, but link from
> con-tiki page follow to the german page... I can't read german and I
> didn't understand ...
I can't help you there.

> 6. What languages are available for programming on Atari ST? Are there
> Pascal?
Several forms of basic (not Visual, of course), Pascal, and C come to
mind.

> 7. Can I connect Atari ST to my PC via serial link or to tcp/ip
> network via modem or ethernet???
Yes. For serial all you need is STing. See
http://www.ettnet.se/~dlanor/ . For ethernet, you need a hardware
adapter. See http://hardware.atari.org/ether/index.htm . Note
however, that the ethernet adapter may have recently gone out of
production.

Not having upgraded my version of Magic from 5.11, I can't say how much
6.xx will use. I can say that 5.11 takes up just under 1.5Mb of disc
space, small enough to fit entirely on a single high density floppy[0].
Taken from a posting I made just under 5 years ago[1], in reply to a
posting about Magic consuming large quantities of memory:

*****
I've a 4Mb STE and, with Magic 5.11 (I know it's not the latest version)
and no other applications loaded, I have 3343Kb free. This means less
than 753Kb is used by Magic. Of this 753Kb, 166Kb is taken up by
HDDriver for its cache and another 153Kb is taken up by MagXDesk. This
bring the memory down to 434Kb. Then there's the screen memory (32Kb)
and the system variables (min. 2Kb), bringing the maximum memory Magic
uses down to 400Kb.

Adding Spin 0.34, STing 1.22, Xcontrol, HSModem and a few other programs
loaded, the free memory drops to 2853Kb which is more than usable.
*****

[0] Why anyone would want to do that, I don't know. The only reason I
could think of would be on a Falcon, or TT, without a HD[2], with at
least 14Mb RAM and Magic was actually installed on a self-extracting,
auto-bootable ramdisc that had been copied to floppy. Anything less, at
least memory wise, and it's just wouldn't be worth it.

[1] <URL:http://groups.google.com/groups?selm=pJ5i0AAdZtY4Ews6@my-ste.demon.co.uk>

[2] Was the TT issued without a HD?

Regards,
David Bolt

In slight defence of TT and MSTe users, of which I am one, (both machines), I
obviously didn't pay enough attention to the notice an thought that it
was for Falcon/CT60 only. There is also the problem of what to do with
the VME video cards. It is possible to have a double adaptor? If so, I
would want two of the VME version.

Ghostlink always seemed like somewhat of a dirty hack to me but it did
work on all the machines I tried it on. These days I simply just use the
ethernet, so I can't help you with that.

Thanks,
Mark

I think its STING 1.26, everything pings ok, the PC does attempt to logon,
but FTP kicks it off, its like the FTP program isn't setup right, im sure it
should show the "welcome" text as soon as it connects but it dont, FTP
reports the attempted logon so they are connected.

I installed ENEC which shows up on boot, STING does error with DNS lookup
failed or something like that.

I've used the FTP prog before with no problems, but it looks like its not
reading the config files, and the user lists!

got any ideas for another FTP server to try ?

This was indeed sad news. I know Dennis worked hard to support the
Atari community.

It is sad that we know so little about his life away from his computer,
but my thoughts are with his family at this time.

to help you with this, sometimes STs on eBay are overpriced.

Plain 520ST(FM), depending on stuff and soft with it <30EUR
Plain 1040STFM <50EUR, same for 1040STE without RAM upgrade
Mega ST 1 <50EUR, Mega2 or 4 and with Harddrive <100EUR
Mega STE <150EUR, depending on software and monitor (if one comes with
Cubase or the like, 200EUR is ok too)
A Falcon for less then 300EUR ius a bargain as well!

My personal opionion on secondhand pricing, sometimes you can get full
Atari STs for less than this.

If you want an ST class machine, I'd suggest and 1040STE with RAM
upgrade or a Mega STE with RAM upgrade and internal hd.

Keep in mind that a package with monitor might be worth more but
shipping monitors does not always work perfect if you use postage
instead of local pickup for your buy.

HTH,
Matthias

Hi Galen,

thank you again for your opinion. You are right that I can't use the artwork or any coding. So I cannot just disassemble it and write an "emulator" just for that game and give it away. This is what I understand to be a "port".
So if I understand it well, I cannot do a port, even though for free. But I am allowed to write a very close and similar game that takes the idea but doesn't use any piece of the original work. That's what I understand to be a clone of a game.

In other words, though I can look inside the original program and port it for my personal overview only, I must then do a second step and write something what is similar to that original game but doesn't use a single piece of graphics or code from it. I can't steal the work but I just can simulate it in my own "words".

Now I can safely say what game I plan to clone. It's the War in Middle Earth for Atari ST by Mike Singleton & Blizzard Entertainment.
They ported it from Amiga. It's a map-based strategical game with, as I think, some elements of adventure. I like Tolkien's world a lot and so I could pay a tribute to it.

I admit it could have been better, more blocks per object and more
objects but that would have reduced the frame rate although I find the
inability to create your own colour combs for the blocks is the most
limiting factor.

Do you want code or complied programs? Programs may be a better option
as it does not require contributors to all be using the same
extensions, you could then use a menu to select which programs are
loaded and run using the assembler Call function.
I've tired this but can't figure out how/where the RTS command should
go. I have tried several combinations, some don't run the loaded
program, some run hte progem and crash on exit and others run hte
program and appear to exit ok but the desktop is erased when you move
the mouse as though the STOS autoback off command is still in effect.

Keep me up to date via E-mail

Steve,

send me a mail to

exxos_uk

@

yahoo

.co.uk

They disk will have both source and compiled, we all will be using the same STOS folder, though there are 20 or so gaps for extensions so we can add just about them all in there with no problem. The main disk will run like you say from a menu (might need some help with the assembeler menu there!) then it will run the PRG files from floppy, the second disk will have all the source code on from everyone who did a demo, plus a little write up on it to keep the kiddies happy.

I'm not sure about your problem here, E-mail me and tell me what you are trying to do exactly.

I let open the project...

I have now 43 registrations on F30 and 28 on VME.

I need at least 60 for each... I think VME will not go to 60 .
How to do ? Think to create a VME to F30 bus adpator maybe, with a second
VME connector for graphic card...
Hum...possible.. because a such adaptor is only PCB and connectors I think,
so there is no robot programation to pay and we don't need a minimal qty :
it can be 30.

Maybe some of you could do announcement somewhere on some NG and others
where I did not go...

I'm sure that some people do not know the project...and may want one
board...
no ?

I'm very suprised that no Hades users are coming to reserve..
OK, they already have an ethernet card (?)
And they put so much money on their hades (?)

I think an awful lot of hades users just use RTL8390 PCI cards? I thought
Hades had a PCI bus like Milan.

I'm afraid that's very, very wrong. Copyright does *NOT* reference any sort of commercial harm; if you copy something that's copyrighted, even if no money changes hands and sales of the original are not impacted, you're still in violation of copyright laws. In fact, the entire open source software movement relies on this; the licenses for that software rely on copyright to prevent users from copying the software in ways the authors don't approve, even when the authors give away the software for free. (Yes, I'm fully aware that open source software isn't always free in price, but in practice most authors do make it available at no charge.)

As to the general question of cloning a game, it's certainly been done plenty of times. There have been lawsuits over such clones, but I don't know how frequently they succeed or what sorts of criteria have emerged for determining when a clone is a copyright infringement. (Patents are also coming to play an increasingly important roll in this equation, unfortunately.)

Thank you for your information. So you say that I cannot copy a single
piece of that game because it is copyrighted, even though I want to give
it for free, am I right?
It's supposable, no surprise for me at all.

But do you think there can arise a lawsuit even if I write a clone with
other graphics, other texts and a bit other game control (just
"inspired" by the original)?

I don't suppose that Blizzard Entertainment has a patent issuing the
"idea" of the game. If so, then the brand new PC games made after the
Lord of the Rings movies could also get to legal conflict with that game.

> piece of that game because it is copyrighted, even though I want to give
> it for free, am I right?

No, that's not what I'm saying. Copyright applies to "works" -- books, newspaper articles, music recordings, movies, computer programs, etc. It evolved from the earlier forms to the latter; computer programs are about the latest copyrightable works, but the principles were created in earlier types of works. In any event, "a single piece of [a] game" could be something like a color scheme, or a ball that bounces in a certain way, or whatever. Something like that is a very small and minor part of the work as a whole, and using it alone would probably constitute "fair use" -- a rather vague but extremely important part of copyright law that limits the rights that can be claimed by the copyright owner. An example in earlier works would be quoting a single sentence from a book or play.

The problem in all of this is in drawing the line between borrowing an element or two and plagiarising the entire work. Judging by the game clones I've seen, you can probably go pretty far down this path without running into trouble in the computer game realm, but IANAL, and it could be that game authors have simply not bothered sueing smaller knock-offs, even though they legally could. Another factor is that there's a difference between copying the "look and feel" of a program, duplicating its functionality, or whatnot on the one hand and actually using its source code (or disassembled machine code) on the other hand. The latter is much more direct copying than the former. If you want solid answers to these questions, though, you'll have to consult an intellectual property lawyer. As I'm not such a lawyer and am not currently engaged in software development, I've not researched the details of how all this applies, in practice. (I am a book author, though, so I'm more familiar with how it

all applies to books.)

> But do you think there can arise a lawsuit even if I write a clone with
> other graphics, other texts and a bit other game control (just
> "inspired" by the original)?

A lawsuit could arise if you sit in your house and do nothing at all. The questions are: 1) How likely is a lawsuit?; and 2) How likely is the plaintiff to win? IANAL, and even if I were, your descriptions so far of what you have in mind have been pretty vague, so I don't think an answer is possible.

I suggest you look at previous games and their knock-offs and do some research to see who's been sued and who's won the lawsuits. You can then perform your own informal risk assessment and decide for yourself whether it's worth proceeding without legal counsel, hiring a lawyer to answer your questions, or simply avoiding the whole cesspool of "intellectual property" law.

This is certainly a sad state of affairs we're in, but unfortunately, you can't give yourself 100% protection against the possibility of being sued. IMHO, the end result is that the current state of copyright and patent laws is starting to have the opposite to its intended effect -- at least, as stated in the US Constitution: "to promote the progress of science and useful arts."

> I don't suppose that Blizzard Entertainment has a patent issuing the
> "idea" of the game. If so, then the brand new PC games made after the
> Lord of the Rings movies could also get to legal conflict with that game.

I don't think a patent could apply to the idea of a particular game, but a game could use patented technologies (say, the [fictional] patented WhizzBang algorithm for processing joystick input). If one of these patents applies to some game element you copy, you could run into patent troubles. So far, software patents have caused few problems; for the most part, those holding the patents have refrained from sueing everybody in sight. I've seen some speculation that this is because few nations have software patent laws, and the patent-holders are holding off until more nations pass them, at which point they'll go berserk and start suing each other, open source developers, and anybody else who happens to get in the way. With Europe passing software patent laws, we could see this become a problem in the not-too-distant future.

As a practical matter, patent searches are not cheap, at least not by the standards of individuals developing software for fun, so protecting yourself against patent lawsuits by doing the necessary searches is impractical.

But if it really is a 1040 ST (not STF or STFM) as stated then it
may not have a built-in disk drive (that's what the 'F' stands
for) and you would need a suitable external drive. At least that
was the case with 520 STs; I'm not sure if there were any 1040 STs
like that.

Hmmm. That DNS lookup failed message occurs when you have deleted one
specific file or when that file is corrupted. (I wish I could
remember which file. :-( ) However, that isn't your problem. How did
you set up your Atari as an FTP server?

Allow me to clarify. Technically, you are correct. In fact, any
derivative work is covered by copyright, so theoretically all clones
are in violation. However ... copyright is almost always a civil
matter, not criminal, and in civil suits there must be actual
financial damage to claim. If your game is not in competition with
the commerical game (that is, it isn't taking sales away) there isn't
anything to sue for.

I never realized that any 1040 ever came with no floppy, now I know.

Of course you don't actually need a floppy at all on the ST, if you have
game cartidges, (or a hard disk).

Answer seems to be yes, but I do not know the fellow's name. He was at the ACEC (Atari Computer Enthusiasts of Columbus, Ohio) annual sale and swap, taking orders. He has local sources for some parts now.

If you need to find him, and he does not read your message, two organizers of that swap are chwbrown@ee.net and rarenz@columbus.rr.com, and could probably put you in touch with the fellow.

Source record: 17292

On my Atari ST I have noticed modem port.
1. Can I connect obvious external modem to it?
Are there voltage diffrenece?

2. So, if I can use obvious external modem, which soft Do You
recommend (if it exists) for dialing, and for tcp/ip connections
like telnet, and www browser?
Is there any mail client for Atari ST ?

3. It seems hard to find here in Armenia DD floppies... I hope my
Atari will work with HD floppies...

4. I noticed a lot of midi software for Atari ST and two midi ports on
my new computer. Can Atari synthesize midi itself or all soft is
designed to work with external electronic synthesizer?

I've redownloaded STING and replaced the folder a few times, also wiped the
lot off and started again, also setup a bootable floppy to play around with.

I use the FTP server from http://users.otenet.gr/~papval/ , I have used it
before and it worked first time, I've E-mail the guy who wrote it but he
hasn't responded :(this FTP server does show in the logs than user xxxxxxx
is trying to logon so the link is working to some degree.

> Are there voltage diffrenece?

It is a standard RS-232 port. However, it is limited to 19.2K, so you
will not see a difference between a 28K and a 56K modem. It is
possible to modify the serial circuit to make the limit 33.6K, but I
never did that myself.

> 2. So, if I can use obvious external modem, which soft Do You

> like telnet, and www browser?
> Is there any mail client for Atari ST ?

For dialing, use STing. For TCP/IP also use STing. For telnet, I
think that any direct communication program will work -- I'd recommend
STorm (or perhaps I'm confusing telnet with something else). For WWW
use CAB 1.5. Note though, that websurfing on a 8 MHz 1980s era
computer requires patience! It does work, though.

> 3. It seems hard to find here in Armenia DD floppies... I hope my
> Atari will work with HD floppies...

You will find that HD floppies work, but they are not reliable due to
the finer grain on the media. Mail order some DD floppies ASAP.

The Atari can synthesize MIDI, but it doesn't do it particularly well.
It makes an excellent MIDI controller, however.

Hmmm, I fear I'm out of ideas. Does STing work for web browsing or
email applications? Hopefully someone who uses FTP regularly will go
over configurations with you.

Galen

4752. Master Tracks Pro song files won't load

Newsgroup: comp.sys.atari.st
Date: 2004-09-15 15:57:53 UTC
From: david5858@apexmail.com
Message-ID: <d82ca572.0409150757.1fb59f86@posting.google.com>
Source record: 17297

The Master Tracks Pro song files (MIDI files) that I saved to floppy
on my 520ST won't load in my Dell computer (using windows XP).
Instead, XP wants to format the floppy.
It gives me this message: "The disk in drive A is not formatted. Do
you want to format it now?"
Of coarse choosing yes would have erased the MIDI file so I chose no,
which gives you no other options. I took the disk back to Master
Tracks in the ATARI and tried all the other formatting possibilities
that the ATARI offers hoping that one of them would be recognized by
XP within the Dell but got the same message.
I tried reformatting the floppy on the Dell hoping that the ATARI
would recognize it but it wouldn't.
Must be a formatting difference between the ATARI and Windows.
I'm sure others have faced this problem (if that is the problem,
though it appears to be).
Do you know what the solution is, and if not, do you know someone or
somewhere I might go to for the solution?

Normally, (not in this case) to share a disk between a pc and an atari, the disk should be formatted on the PC first. DOS> format /f:720 A: . Then it can be used on both systems. You might need to put tape over the HD hole on the floppy so that the PC disk drive doesn't complain about the disk being used as a DD instead of an HD.

The reason for formatting on the PC is because the atari format does not write a signature byte that the pc expects, and so the pc refuses to read the disk.

There are at least 2 solutions to reading the atari disk if it was not formatted first on the pc.

1.

What I do for this is to boot my pc into linux. Then I mount the floppy as type 'fat'. Linux will read the floppy with no problem. Copy the contents onto the pc hard drive. Later when you reboot back into windows then the files will be there on the hard disk. At that stage the pc can use the files, and you can also copy them to a new, correctly formatted, floppy to share with the atari.

To use linux, there are various very small linux distributions that can be installed on your pc that do not require any kind of disk reformating (they use the same file system as windows), and take up very little disk space. Using one of them would be the easiest way to run linux. 'minilinux' is a name that comes to mind, but there are other's that are more up to date (google will find them, I'm sure).

2.

I have read of a utility that updates the signature byte on the floppy. Then the pc will read it ok. I do not know the names of this utility, though.

A third solution also springs to mind right after saving the first post.

Format a floppy on the pc, as mentioned above.

Now use the atari to copy the contents of the first disk to the second
disk. The second disk can then be shared with the pc, and becomes your
new master copy for atari files.

: 1.

: What I do for this is to boot my pc into linux. Then I mount the floppy

Jumping in late here so if I missed something....sorry.

I'm understanding that at this point pings to and from all your machines work as they should.

Some things to check:
Find out the MTU of your ISP.
Set everything on your lan to the same MTU.
MSS should be your MTU minus 40.
RWIN (on the Atari) should be 2 or 3 multiplied by the MTU.

More modern ethernet cards on your PC/Mac hardware might can take much higher RWIN values (4 to 8 * MTU).
Example:

MTU = 1442
MSS = 1002
RWIN = 3326 (MTU*3 ... if the NEC card's buffer seems to overflow, try MTU*2)

Having this set up properly will make things faster (less packet splitting-reassembly).

DHCP (a protocol to automatically assign dynamic IP address to devices plugged into your LAN) stuff isn't full and complete when using STing with an ethernet LAN....so: Some routers/switchers are pretty smart and dummdumm proof, while others need more user interaction to get them to work well. So! You might want to go ahead and disable all the DHCP stuff, and give everything static IP addresses on your LAN.

If you're networking with a DOS or Windows PC, try entering the following command (using your IP and Mac addresses) at a DOS prompt (or in autoexec.bat).

c:\windows\arp.exe -s 192.168.1.8 00-00-1c-1c-32-a7
| |
|
Static IP switch__| | Mac Address for
eNEC card.
|
Atari's IP Address (You set this in STing)

Some unix like setups that might be on your LAN need some manual arp tweaking as well....depending on which set up, and how old.

If your eNEC is connected directly to a PC (ethernet card to ethernet card):
Check you've the correct type cable. Some ethernet cards need a twisted cable when you're not using a 'router or switcher', some have a switch, while others will automatically detect your cable type and it doesn't matter. You'll

definately need the arp setting as above if you're not using a router/switcher!

If you use an ethernet switcher or router, check to see if there is a way to register your eNEC adaptor via Mac Address on a fixed ip address. It's usually a telneted command similar to that above for windows, or sometimes is set via web browser query to the default gateway on port 80, or 8080.

If you use an ethernet switcher or router, check that you've not done some sort of NAT redirect for the standard ports (I.E. redirect all calls to port 23 to the Windows machine). In general, this doesn't matter from inside your LAN, but it's worth checking out!

If you use an ethernet switcher or router...ALL attempts to connect to any of your machines from the internet will require NAT port redirection. If you use such a device....learn all about it ;)

Good luck...
Brian

Chris,
Do you use STing per chance? Maybe with a Dynaport ethernet adaptor on the SCSI
bus?
If you do...open the STing CPX and disable it before using the Floppy drive.

Also, get your hands on the Falcon auto folder patch called FLOP_FIX.PRG.

And finally the obvious...try fresh disk(s). Maybe a head cleaning on the
drive.

thanks for the info, some things to try there :)

my falcon is linked direct to my pc, nothing else, im not using internet, just a LAN and thats it, simple file transfers....

im using a ftp server on my falcon, so i can logon with a ftp client on my pc, the atari side reports the username i am trying to logon with (from pc) but it wont let me logon, seems like a password error, but thats all fine, i have had it working in the past and its got me stumped :(

Well I googled the display range (15khz) and found one reply that made
new ones, I think most monitors that sync down to 15khz are used in
Medical equipment/Industrial uses so I didn't ask how much they ran :)
Microvetic was the manufacturer..used will be cheapest route I
believe, maybe you can get an older amiga monitor (I found a NEC II
multi sync for a decent price) but I'm spoiled by my 21 in monitor I
use now. hard to go back to 14 or 15 in monitors

I understand, but I own a Falcon, and I'm wondering how to get all those ultra cool/snazzy RGB demos to run on a S/VGA monitor? Most don't synch down below 30khz, so whats a person to do?

Years ago, with my very first Falcon, I had a VGA monitor that would synch down to 15khz, and I hooked the Falcon up via the Multisynch Gizmo, so there was no switching. I could run in VGA mode, and just click any RGB software (such as demos) and off it would go.

I'd really like to have a setup like that again.

Thanks.

There is software that will allow higher speeds called HS modem you
can get a copy form here...

http://www.umich.edu/~archive/atari/Utilities/Tosfixes/ or

http://www.flinny.demon.co.uk/download.html you should probably have a
look here anyway if your thinking about connect your Atari to the
internet

HS Modem allows much faster speeds IIRC 115000 is the maximum internal
speed (computer to modem) without hardware modification which allows
my to have connection speeds of 43-44K. This was on my Falcon but I
think the same speed applies to ST's.

You might find new modems that have serial port connections as opposed
to USB but you will probably have to purchase a second hand unit. I
have changed to using a PC for my internet browsing and happen to have
a Phonics V92 56K Voice/Fax that I am no longer using if you or anyone
else is in the market for a modem.
I was using it with my Falcon so it does work, the interface cable has
both 9 and 25 way connections so it will connect to either an ST or
Falcon UK/Euorpe. The outer box it a little battered but everything
else in in as new condition and it is just over a year old. Cost £60
new will sell for £40 (includes postage), PayPal is prefered method of
payment.

If you do a web search you should be able to find a few places from
which you can mail order new and/or used DD floppies.
If you don't mind ordering from the UK you can try...

Other than buying a used VGA monitor I think there are three options
available to you:

1. Buy a used Philips CM8833 RGB or Atari 1435/Amiga 1084S monitor,
and use a switchbox.
2. Use a TV (?)
3. Buy a scan convertor. Have a look at www.lik-sang.com, they have
devices that you can send an RGB signal to and it will upscan it to
SVGA (like an Xbox -> SVGA adapter).

Coda.

I have a gizmo that accepts SVHS or composite video and outputs a
scan-rate doubled signal for a "normal" SVGA monitor. Google for Console
Adaptor or similar, mine seems to be made by Venom?

Expect some flickering.

(some of these are "shooters")

Dungeon Master/Chaos Strikes Back
Ultima 3,4,5
Stardust (STe/Falcon only)
Spacequest (any in series)
Wrath Of The Demon
BattleChess
Star Fleet 1
Xenon 2
Turrican 2
Gods
Chaos Engine
Speedball 2
Blood Money
Carrier Command
Arctic Fox

Just for a start - there are lots of great games out there. :-)

Hi Bill. Actually, after googling around a bit - I did find that site.
Quite a large list of monitors there. Unfortunately, everytime I found a
multisynch that would work (Ideks, just for an example), they would turn
out to be no longer manufactured.

Its a big website though, and I've not had a chance to go through every
listing so I'll keep my hopes up...

Thanks!

(maybe should I put that on ebay but I try on atari ng first : don't blame me)

I sell at the first four most offerers, 4 logos for thermical transfert on T-shirt.
This logo was the official logo of the Phenix from Centek that was put on the Centek men's T-shirts for the French and German shows during 1998 & 1999 (a great period, no ?) !

There are the only ones, no others...
They are a collector.
http://www.czuba-tech.com/Phenix/transfert.jpg

With the french (ok I will translate it) manual explaining how to transfert successfully on your T-shirt and how to wash it carefully :
http://www.czuba-tech.com/Phenix/transfert_doc.txt

It is a very good quality because I have here my T-shirt after 5 years and the picture is nice on it..

The money is used for atari developments...

Merci

Only with early TOS versions. From TOS 1.04 onwards, disks
formatted on the Atari using the desktop's function should be
readable by a PC.

>
>There are at least 2 solutions to reading the atari disk if it was not
>formatted first on the pc.

Actually there is another one: Use a formatter on the Atari like
Fcopy, which can write DOS-compatible disks. But of course you
then have to copy the original data to the disk. This can be
skipped if you use the method below!

>2.
>
>I have read of a utility that updates the signature byte on the floppy.
>Then the pc will read it ok. I do not know the names of this utility,
>though.

It's a small (7 kB) program called DISKMOD.TOS, used together with
the 512-byte BLOCK0.DAT which contains the actual boot sector to
be written to the disk. The advantage is that you can convert an
early-TOS Atatri disk into a PC-compatible one without harming the
data on the rest of the disk - so no need for copying (though a
backup might be a wise precaution).

If anyone wants a copy (and can handle MIMed files) drop me a mail.

Regards, /Peter/

4777. [ANN] Troll 1.0B

Newsgroup: comp.sys.atari.st

Bonjour :)

Reminder: Troll is an next generation usenet client for Ataris and
GEM environement. StiK2 or compatible layer needed.

Download on my homepage or directly in the folder
http://rajah.atari.org/files/ -> troll10b_uk.zip (124KB)

News for this 1.0B
- Bugfixes for:
- crash at start with XaAES (shel_write).
- bad URLs detections (infinite loop in some cases).
- minor case for filenames under MiNT.
- line return in the internal text editor.
- possible crash when downloading new headlines when the
headlines list is empty. Thanks to Jean-Luc & ProToS.
+ ST Guide English documentation
+ Newsgroup preferences that can:
> force the sequential headlines display.
> declare an identity for replies or new subjects.
+ Identities management (carefull, the old one is lost).
+ New newsgroups subscribing formular:
> newsgroups list sort.
> big enhancement for the direct search on the server.
> download or update of the entire newsgroups list of
the server (carefull: slow and needs a lot of RAM).
> search in the downloaded newsgroups list.
+ GDOS/NVDI post printing (set it in the misc options)

Bye bye :)

Although HS Modem does indeed allow a port to be controlled up to
115.2K, not all Falcons can do so. Mine, for instance is faster at
57.6K since 115.2K creates many resends. STs are another story. I'm
pretty sure the ST port is 19.2K unmodified and 33.6K modified.
Anyone else care to jump in?

Galen

If you search groups.google.com you will find that the question has
come up occasionally in the past. As for myself personally, Dungeon
Master, Chaos Strikes Back, Railroad Tycoon, Sundog, and Civilization
are my most frequent picks for when I have an afternoon free. I also
liked Carrier Command, but I couldn't finish it (never found the enemy
carrier, despite taking over every island) and Populous II (though it
started bombing out on me after level 60 or so). Currently I'm
playing M-1 Tank Platoon and Secret of Monkey Island.

Some said he was a twisted foul mouthed twat!!, I did see and kept a record of many mails with a vast amount of swearing that he sent to support this view, and I had to stop my children reading this group and sell off my last Atari's and games (Thanks Den), maybe this is what happens to ones brain as a disease starts to eat your body!! before you die?, we must assume this is what was going on and forgive him for this.

Wasn't there a hardware/software patch for the STs called something like
RSVE? I think its at the Atari workshop?

http://www.atari-workshop.co.uk/products/modems.htm

I thought it would allow higher speeds.

Doubles the clock rate of the port IIRC, but the problem might be that
the rest of the computer starts dropping data because it can't keep up
with the higher data rate. That will be worse when using higher colour
depth and resolutions.

The Falcon has a faster processor so it can cope with higher speeds.

The RSVE board is an expensive way of modding the port anyway, ISTR that
a changeover switch would do the same job?

Hello.
Yesterday I tried make a disk for Atari on my mom's PC (Dell Optiplex pII450mhz running w2k and Fedora) ;)
For the first time I tried it with winXP... and understand that XP can't format floppies with 720 kb ;) Onlly 1.44 mb ;)
THen I tried w2k. It tells me that my floppy drive can't support 720kb flopies and refused to format disk. ;)
Then I rebooted into my favourite system - Fedora Core and made
fdformat /dev/fd0h720
mkdosfs -A /dev/fd0h720
It works perfectly, but a little slow!
Then I wrote to floppy some games from ftp://chapelie.rma.ac.be/atari/ and it works!
Cool!

So, one question about mouse...
I noticed that my Atari ST have 4 ports for joysticks...
Near the one of these ports (on the bottom side of comp) there is a mouse picture... SO I connected standart PC mouse that connects to the serial port, and it didn't work...
Is Atari ST use non-standart mouses??? Or may be system don't know that I connected a mouse...
Thank U a lot.

Hiya,

norik wrote:
> So, one question about mouse...
> I noticed that my Atari ST have 4 ports for joysticks...

Sounds like an STE modell then. Most games do not make use of the
additional analogue joystick ports. However you can connect Jaguar pads
to them and many modern games for STE and Falcon do support these
socalled Jagpads. Afaik they are non standard however and I don't think
you can PC analogue joysticks to them.
The joystick ports below the case are the standard ones with DB9
connector. 99,9% of all games with joystick support do support a
joystick plugged into port 1, the one with the joystick sign.

> Near the one of these ports (on the bottom side of comp) there is a
> mouse picture... SO I connected standart PC mouse that connects to the
> serial port, and it didn't work...

A serial mosue for PCs will not work with the standard mouseport.
However you can connect it to the modem port of your ST (with an
appropiate adaptor) and a special driver. The problem is that many
programs especially games and demos will not be able to use this mouse
as the driver only replaces OS routines. Most games bring their own
driver and support the Atari mouse only.

> Is Atari ST use non-standart mouses??? Or may be system don't know
> that I connected a mouse...

The Atari ST mouse is non standard in the way that it is neither a PS/2
nor a serial mouse with MS protocol. It is its own Atari standard but
compatible with Amiga mice as well. Only the vertical axis is swapped
around but afaik that can be altered with a simple adaptor. Some mice
for Amiga and ST are switchable and bring a small switch so you adjust
on which machine you want to use the particular mouse.

HTH,
Matthias

> anything to sue for.

IANAL, but I don't believe that's entirely correct -- or if it is, it's
too narrow of an interpretation. Consider open source software, which is
released under terms that permit free (no-cost) re-distribution under
certain terms but not others. If your argument were correct, licensing a
program under an open source license would be legally equivalent to
putting it into the public domain, since the authors would suffer no
monetary damages if somebody were to violate the license (say, by
incorporating GPLed code into a commercial product). The GPL was written
by lawyers who, by all accounts, are pretty smart, so I tend to think
they knew what they were doing. (Likewise for most other common open
source licenses.) Thus, I find it hard to believe that a strict monetary
loss criterion exists -- or if it does, the law must permit other types
of damages to be converted to monetary terms. (For instance, "this use
damages our reputation, and this damage to our reputation has a value of
$1,000,000.") In fact, the latter is basically what slander and libel
lawsuits (another type of civil, rather than criminal, violation) are
about.

In either case, the absence of damage to sales of a game wouldn't
necessarily protect somebody who writes an infringing game. The copyright
holder could sue over the violation despite the lack of lost sales (in

the first case) or claiming that the violating title might damage future sales, ports to a new platform, etc. Just because your actions don't cause DIRECT monetary damages doesn't mean somebody won't try to put a monetary value on them in court and put you in the poorhouse.

Just to be clear: I don't LIKE the way this all works, but the fact is that our society (particularly in the US, where I happen to live) is a pretty litigious one.

>think the same speed applies to ST's.

The hardware on the ST is limited to 19.2Kbps without a hardware modification[0]. Most of these modifications allow the speed to be doubled to 38.4Kbps by over-clocking the RS232 section of the sound chip. The problem with this modification is that, as I found out, unaccelerated STs are unable to keep up with the data flow and there are the occasional dropped character.

By using Magic, this problem disappeared, although it did return when I increased the over-clocking of my modification[1] to allow for a 57.6Kbps serial port.

When I was using this modification, back in 1998, I found that using 57.6Kbps and Magic while using BBSs I could reliably download files using GSZRZ[2] with no errors or retries, and also only the occasional character lost when navigating the menu systems. On the other hand, with the exact same system, 57.6Kbps was unreliable when using STing to connect to the net, and the transfers were much slower than 38.4Kbps.

Using the same system under TOS and the top limits were reduced. BBS file transfers were reliable at 38.4Kbps, but while using STing the

speed had to be dropped to 19.2Kbps.

[0] Even withough the modification, the serial port routines were buggy
and HSmodem was to be recommended. Not only did it fix a few bugs, it
also seemed to speed up the serial port handling.

[1] The original high speed modification was to take the increased clock
signal from the motherboard before it was divided down and, after
passing it through a switch to allow selection of the lower speeds, fed
it into the bit of the sound chip that generates the serial bit-stream.

My modification was to use a couple of signal generators, one at double
the normal frequency and the other at triple the normal frequency, and
after passing these, and the original clock signal, through a three-way
switch feed it into the sound chip.

[2] As long as the mouse interrupts were disabled.

Regards,
David Bolt

You can still find these monitors, but you will pay quite a premium.
One place to look is in process and control system monitors. For
example, http://www.replacementmonitors.com/specs/27dmseries.asp would
work nicely. (I have no idea how much it would cost for one of these,
but my guess is lots.) The other option would be to use an arcade
monitor. Unfortunately, 27" is about the SMALLEST you will find.

A far cheaper option would be to purchase a scan convertor like the
Viewsonic Nextvision N4. This solution would probably require you to
make a custom cable however.

Best of luck on your project.

Galen

A quick check to http://atari4ever.free.fr/hardware/serial.html shows
several projects for the serial port, including some that claim to be
able to take the ST port up to 115.2K! Does anyone actually have an
ST that fast? My Falcon can't even do 115.2K reliably.

Hi everybody,
I should "complete" two Atari mice for my two Atari STs. They're working
but I just have the main part. So I'm looking for two mouse retainers
and, if they're not exactly the same used in PC mice (different sizes?),
two mouse balls.

I will be happy and grateful (a virtual beer? ^,^) if someone can help
and send this stuff to me :)

Thank you in advance.
Regards!

Considering PS/2 mice, I've just found this. It is an active convertor
that will not need a driver on the Atari ST.
http://members.aol.com/tgkirk/ps2mous.htm
As that will connect to the ST mosue port and efefctivly behave like a
real ST mouse, it will be a perfect replacement. Might be interesting
and it loosk not hard if you already have some knowledge on electronics
and soldering.

HTH,
Matthias

For the butter fingered the Eiffel board is a good bet, it allows you
to use PS2 mice and keyboards (you will loose hte use of the orginal
atari keyboard) and is pretty much just plug n play, though if you
want to remap the help/undo keys you need to use a small boot program.
but it's totally solder free, it just has a lead that plugs into the
keyboard port where your atari keyboard plugs into now insdie the
machine. The baord is fit enough to go intoa normal ST case or there
are external versions availible if you want them, but htey cost more.

http://atari.sk/satantronic/
Satantronic do the cheapest version, but internal only.

http://perso.wanadoo.fr/laurent.favard/eiffel_e.html
For external version

As for hte Atari mouse itself, as has already been said although it
looks liek a PC serial mouse it actually works differently. it's worth
getting away form the Atari mouse if you can as as well as just being
clunky and having a low resolution, the way they connect under hte
keyboard means hte ports tend to break fairly easily if you have to
plug and unplug it very often, and fixing the mouse port is a
nightmare.

Source record: 17101

Hi,

I'm the one that bidded on the Ethernec/Eiffel package on eBay. I intend to continue where Lyndon left off. At the moment, I am trying to procure a source for the ISA ethernet cards. At the moment I have only a few circuit boards for the Ethernec, but I will order more as soon as I am able to fund it. I plan to do 50-75 sets the first run. I am not sure as to the cost per unit at this time so please bear with me. I will try to keep it in line with current pricing but we'll see.

I am not an electronics expert (more of a tinkerer) by any means, however, every unit will be hand built by me & tested by me on my Stacy running Magic. These units take about 2 hours to make. More time if you want a plastic case for them. The cartridge port isn't cut to fit the cartridge slot, so each one has to be cut and filed to shape.

At this time, I would ask you to grab Lyndon's form, fill it out and send it to me at my yahoo address. These will be made and delivered in the order in which I get them. Those who ordered at the show will get at least one at first and their remainder order at beginning of the first batch. The address is listed below, removing nospam from the middle of my last name is required to contact me. Hopefully, I will confirm your email and shipping address within a day or two.

I can take orders for eiffel, but I will order the pcb's later after getting the ethernec project going. Prices may differ from lyndons, depending on how many I will order.

At this time, things are a little rough here. My father is dying of cancer, so time (for me) is at a premium.

However, this task (ethernec) will be taken with the utmost care and as promptly as possible. I have been patiently waiting to have ethernet for the Atari machines for some time. I know all of you are too. I will always keep that in mind.

Thanks for being patient,
Rory McMahon

Hallo Dark!

DW>though if you want to remap the help/undo keys you need to use a small
DW>boot program.

With more recent versions of the firmware, this is no longer necessary. You can now permanently remap all keys in set 3 and a lot of keys in set 2.

Eiffel gives you another improvement over the original mouse, though: You can use modern optical wheel mice. Normally, the wheel will be mapped to the cursor up/down keys, but this is also configurable.

With best regards
Ekkehard

>7. Can I connect Atari ST to my PC via serial link or to tcp/ip
>network via modem or ethernet???
>Thank You very much.

Hello,

Yes you can use standard 3.5" floppies. I use them on my 1040STe.
On a 1040 the OS is built in. You can get other OS's like Mint and
Magic. You can find tons of programs for the 1040. Try some of
these sites:

http://users.pandora.be/tos4ever/utsi.htm
http://www.multimania.com/falkweb/utsi.htm
http://www.umich.edu/~archive/
http://www.funet.fi/pub/atari/

There are some formatting programs that make it so that you can
make a floppy that can be used on the PC and Atari computers. If
you have TOS 1.4 or above, using the built-in format option will
do this automatically. There are also Word Processing programs
that can save text files in RTF format that can be loaded into a
PC work processor. I have done that before. GFA Basic and Pure C
are two programming languages that are commonly used. I have my
1040STe hooked to my Ethernet using software/hardware that uses
the computer's cartridge port. Works great....

I have a 56K modem hooked to my Atari. Works fine, but I mainly
use my cable modem. I would reccomended STiK2 or Sting version
1.26 as the software for tcp/ip connection. Starcall is another
good piece of software that can be used for logging onto regular
BBS's...HD disks may work in an Atari ST, but you will not be able
to use the HD option. You may still just get 720k per disk. YOu
can install a HD drive into a ST computer and it will work if
modifications are made in the ST.

I am using the same setup as you on a 1040STe and the FTP 1.09
works fine. You may be correct in that the ftp program is not
reading the config files. What exactly happens when you run the
program? Are you trying to transfer files, etc?

I have had it working fine the first time I set it all up, theres no reason
why it shouldnt work now.....

I load up FTP, all the config files are correct..... I'm just using "C" for
username and "*" for password, when I logon from my PC, its says 500 access
denied. On the ST the log for FTP says "User C password * logged out" and
thats all it says.

When you logon with your PC do you get the welcome note BEFORE or AFTER the
username ??

I am sure the welcome note should come before it asks for the username!
can't exactly remember, but it made me think that its not reading the
welcome and users files. I have copied the files everywhere and even did a
new copy on floppy to try..... I've tried everything, dont make sence at all
:(First time around all worked perfectly, the only thing which changed was
I reinstalled windows a few times, but all I had to do was put the IP back
into windows and upto now thats worked fine.. though this time it wont have
it at all :(seems like a FTP fault on the ST, but everything is setup
perfectly!

chris
